### Supporting Information

**General:** All reactions were performed in flame-dried glassware under a positive pressure of nitrogen using freshly distilled solvents. Tetrahydrofuran(THF) was dried by refluxing over sodium/benzophenone ketyl until a permanent purple coloration was presented and other solvents(dichloromethane, toluene) also were distilled prior to use. All liquid reagents purchased from the Aldrich, T.C.I. and Acros companies were distilled properly prior to use, unless otherwise indicated. Purification was conducted by flash column chromatography on silica gel (230-400 mesh), eluting with a mixture of hexane and ethyl acetate unless otherwise stated. All reactions were monitored by thin layer chromatography carried out on Merck glass silica gel plate using UV light as visualizing agent and ethanolic anisaldehyde, KMnO<sub>4</sub>, PMA solution and heat developing agent. FT-IR spectra were recorded on Nicolet 205. <sup>1</sup>H NMR spectra were recorded on a Varian Unity Inova at 300 and 500 MHz in CDCl<sub>3</sub> as a solvent with TMS or residual chloroform as the internal standard. <sup>13</sup>C NMR spectra were measured on a Varian Unity Inova at 75 and 125 MHz in CDCl<sub>3</sub> as a solvent. Gas chromatography (G.C) analysis were performed on Younglin Acme 6000 Series GC system equipped with flame ionization detector using J & W Scientific Cyclosil-B column (30 x 0.25 mm) or γ-TA column(30 x 0.25 mm).

## Experimental Section

(1*R*, 2*R*, 4*R*)-2,2,2-trifluoroethyl-1, 4-dimethyl-7-oxa-bicyclo[2. 2. 1]hept-5-ene-2-carboxylate (4).

A 100-ml, two-necked, round bottomed flask equipped with a stir, a glass stopper and a 50-ml pressure-equalizing addition funnel (containing a cotton plug and ca. 10 g of 4Å molecular sieves and functioning as a Soxhlet extractor) fitted on top with a reflux condenser and a nitrogen inlet adaptor was charged with (S)-(-)- $\alpha,\alpha$ -diphenyl-2-pyrrolidinemethanol (82.0 mg, 0.324 mmol, from Acros), tri-*o*-tolylboroxine (38.0 mg, 0.107 mmol) and 25 ml of toluene.

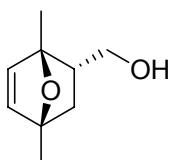

The resulting solution was heated to reflux (bath temperature  $\sim$  145 °C). After 3 h, the reaction mixture was cooled to ca. 60 °C and addition funnel and condenser were quickly replaced with a short-path distillation head. The mixture was concentrated by distillation (air-cooling) to a volume of ca. 5 ml. The distillation protocol was repeated three times by re-charging with 3 x 5 ml of toluene. The solution was then allowed to cool to room temperature and the distillation head was quickly replaced with a nitrogen inlet adaptor. Concentration in vacuo (ca. 0.1 mmHg, 1 h) afforded the corresponding oxazaborolidine as a clear oil, which can then be dissolved in CH<sub>2</sub>Cl<sub>2</sub> and used in Diels-Alder experiment.

To an aliquot of oxazaborolidine precursor (0.160 mmol, theoretical) in 2.0 mL of CH<sub>2</sub>Cl<sub>2</sub> at -45 °C was added trifluoromethanesulfonic acid (667  $\mu$ L, 0.133 mmol)

dropwise. After 10 min at -45 °C, a colorless homogeneous catalyst solution was ready for use in Diels-Alder reaction. Trifluoroethyl acrylate(340  $\mu$ l, 2.68 mmol) and 2, 5-dimethylfuran(714  $\mu$ l, 6.70 mmol) were added successively at -95 °C. The reaction mixture was stirred for 2 h at same temperature and then quenched by addition of 20  $\mu$ l Et<sub>3</sub>N. After the mixture was warmed to room temperature, the solvent was removed by rotary evaporation and residue was purified by silica gel chromatography (ethyl acetate–hexane, 1 : 5) to afford 640 mg (95%, *endo*) of **4**, Diels-Alder adduct: TLC : R<sub>f</sub>= 0.54(ethyl acetate-hexane , 1 : 3); FT-IR 3076, 2977, 1754, 1634, 1284, 1171 cm<sup>-1</sup>; <sup>1</sup>H NMR(500 MHz, CDCl<sub>3</sub>)  $\delta$  6.27(d, J= 5.7 Hz, 1 H), 6.04(d, J= 5.7 Hz, 1 H), 4.56(dq, J= 3.9, 17.1 Hz, 1 H), 4.31(dq, J= 4.2, 17.1 Hz, 1 H), 2.99(dd, J= 3.9, 9 Hz, 1 H), 2.01(dd, J= 9.0, 11.7 Hz, 1 H), 1.86(dd, J= 3.9, 11.7 Hz, 1 H), 1.74(s, 3 H), 1.60(s, 3 H); <sup>13</sup>C NMR(125 MHz, CDCl<sub>3</sub>)  $\delta$  170.7, 140.5, 135.8, 122.8(q, 1C, J= 277 Hz), 87.3, 86.2, 60.1(q, 1C, J= 37 Hz), 50.8, 38.1, 81.6, 81.4; LRMS calcd for C<sub>11</sub>H<sub>13</sub>F<sub>3</sub>O<sub>3</sub>: 250.08 ; found 250.1; [ $\alpha$ ]<sub>D</sub><sup>21</sup> +29 (c 1.0, CHCl<sub>3</sub>, >99% ee). Diastereoselectivity (*endo*-*exo* ratio) was determined by <sup>1</sup>H NMR analysis of the crude mixture <sup>1</sup>H NMR  $\delta$  6.17 (d, 1H, J= 5.6 Hz, *exo* minor), 6.04 (d, 1H, J= 5.2 Hz, *endo* major). Enantioselectivity was determined by double bond reduction with H<sub>2</sub> in the presence of 10% Pd/C and GC analysis ( $\gamma$ -TA, 110 °C, 10psi) retention times: 3.72 min(*endo*, major), 3.99min (*endo*, minor).

The starting material **12** (20 mg, 0.09 mmol) was dissolved in CH<sub>2</sub>Cl<sub>2</sub>(2 ml) and PCC(60 mg, 0.27 mmol) with celite(60 mg) was added to a reaction mixture and stirred for 3 h at room temperature. The reaction mixture was then filtered through silica gel and celite to afford crude product **13** (17 mg, 86%): TLC : *Rf* = 0.74 (ethyl acetate-hexane, 1 : 1); FT-IR 3427, 2958, 2855, 1731, 1453 cm<sup>-1</sup>; <sup>1</sup>H NMR(300 MHz, CDCl<sub>3</sub>) δ 9.84(s, 1H), 3.69(s, 3H), 2.91(d, J= 6.3Hz, 2H), 2.35(m, 1H), 2.04(dd, J= 6.6, 12.3Hz,

**(2S, 3R, 5R)-5-(carboxymethyl)-2,3,5-trimethyl-tetrahydrofuran-2-carboxylic acid (1).**

This crude aldehyde **13** (17 mg, 0.079 mmol) was dissolved in THF-H<sub>2</sub>O- tert-butyl alcohol (0.5 ml, 4:4:1) and 2-methyl-2-butene(0.2 ml, excess). A solution of 1 N NaClO<sub>2</sub> (180  $\mu\text{l}$ , 0.18 mmol) and 1 N NaH<sub>2</sub>PO<sub>4</sub> (365  $\mu\text{l}$ , 0.365 mmol) in water was added dropwise. The pale yellow reaction mixture was stirred at room temperature for 3 h. The mixture was then diluted with saturated aqueous NH<sub>4</sub>Cl(2 ml) and extracted with ethyl acetate(5 x 10 ml). The combined organic extracts were washed with brine (5 ml), dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated to give crude monoester adduct. This crude monoester was dissolved in aqueous NaOH (0.3 ml, 2.0 N) and the solution was stirred for 6 h. Hydrochloric acid (1.0 M) was added to adjust the solution to pH=1. The aqueous phase was then extracted five times with ethyl acetate. The combined organic phase was dried over Na<sub>2</sub>SO<sub>4</sub>. The solvent was removed, and the residue was purified by chromatography on silica gel (elution with CHCl<sub>3</sub>-MeOH, 9 : 1) to furnish 15 mg, 90% of (+)-cis-nemorensic acid (**1**): FT-IR 3129, 2921, 1716, 1650, 1457, 1115  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR(500 MHz,  $\text{CDCl}_3$ )  $\delta$  2.84(d,  $J= 15.0\text{ Hz}$ , 1 H), 2.80(d,  $J= 15.0\text{ Hz}$ , 1 H), 2.46(dq, 1 H), 2.09(dd,  $J= 6.5, 12.5\text{ Hz}$ , 1 H), 1.87(t,  $J= 12.5\text{ Hz}$ , 1 H), 1.53(s, 3 H), 1.37(s, 3 H),
