

Supplementary Material for the article:

Examination of intermolecular electronic interactions in the crystal structure of $C_{60}(CF_3)_{12}$ by experimental electron density determination

Authors: Lilianna Chęcińska, Sergey I. Troyanov, Stefan Mebs, Christian B. Hübschle and Peter Luger

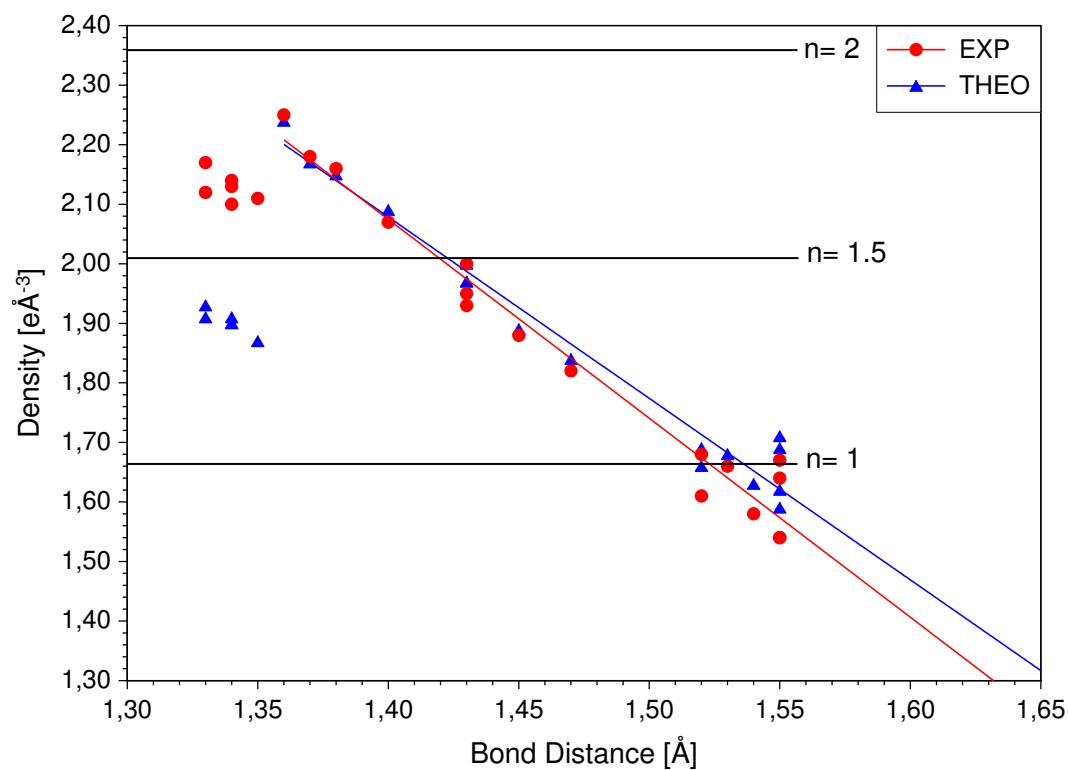

Figure sup_1: Plot of $\rho(r_{BCP})$ values [$e\text{\AA}^{-3}$] versus bond length [\AA] for the C-C bonds in the title compound from experiment and theory (single point: B3LYP/6-311++G(3df,3pd)). The data for the C-F bonds are also shown as a small cluster at a bond lenght around 1.34 \AA .

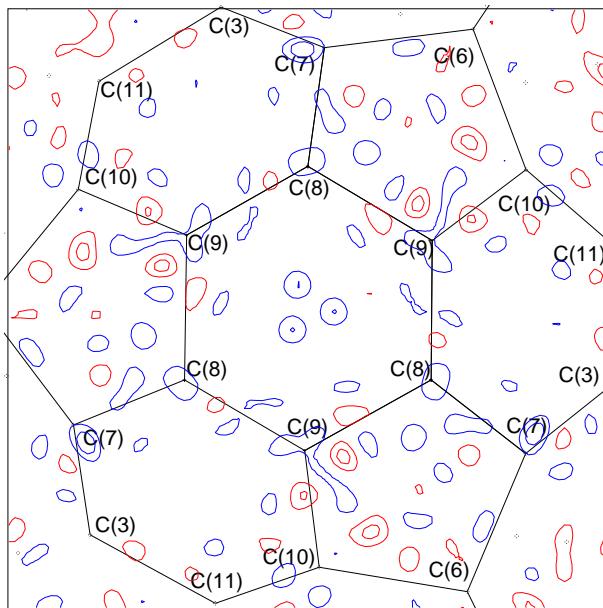

Figure sup_2: Residual density in the plane of the six membered ring. Blue/red: positive/negative regions. Contour interval 0.1 [$e\text{\AA}^{-3}$]. Adjacent atoms shown for illustration.

Table sup_1: Multipole population coefficients

| x18 | | 3612.2* | | |
| V_{cell} | | 3617.3 | | |

*Bader atomic volumes and charges are additive. The sum of atomic volumes in a given unit cell should be equal to the experimental cell volume. Similarly the sum of all atomic charges should add up to zero. For the title compound the sum of V_{tot} reproduces the unit cell volume within less than 1%, whereas the charges add up to 0.02 e, being indications that the integration procedure for atomic properties has worked properly.
