*General Procedure for Synthesis of Complexes 5a-5e:*

A flame dried and nitrogen cooled Schlenk tube was charged with **3** and dry benzene (10 mL). The solution was treated with freshly prepared 1M sodium ethoxide solution and stirred for 10 minutes. After this time, **4a** or **4b** was added and the mixture stirred for 5 h at r.t. The solvent was removed under high vacuum and the residue triturated with dry ether prior to filtration through celite under N<sub>2</sub>. After solvent exchange to dry THF (15 mL), AgPF<sub>6</sub> was added and the resultant slurry stirred for 30 minutes at r.t. After filtration through celite under N<sub>2</sub>, the solution was treated with phosphine and the resultant ruby red solution was stirred for 2 h. Purification by recrystallization from DCM/Et<sub>2</sub>O yielded the desired complex.

Following the general procedure, data are reported as: (a) amount of **3**, (b) volume of sodium ethoxide, (c) amount of imidazolium salt, (d) amount of AgPF<sub>6</sub>, (e) amount of phosphine, and (f) product yield.

*Standard Hydrogen Isotope Exchange Procedure:*

A flame dried and nitrogen cooled 250 mL 3-neck round bottomed flask, equipped with two stopcock valves and a suba seal, was charged with the iridium complex (5 mol%) and dry DCM (2.5 ml), followed by the substrate (0.215 mmol). The suba seal was replaced by a greased glass stopper and the reaction vessel was cooled to -78°C in a dry ice/acetone bath, prior to being purged twice with nitrogen. The flask was then evacuated and filled with deuterium gas *via* balloon. The flask was removed from the slurry and allowed to warm to room temperature. (NOTE: the glass stopper must be physically restrained as the reaction mixture warms to room temperature). The reaction mixture was then allowed to stir vigorously at room temperature for the allotted reaction time. The level of isotope incorporation into the substrate was determined by <sup>1</sup>H NMR analysis of the reaction products. As such, the residual proton signal from the site of incorporation was compared against that of a site where incorporation was not expected or occurred.
