Metathesis reaction: synthesis of **30**

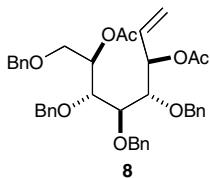

Diol **2** (500 mg, 0.88 mmol), was dissolved in a mixture of pyridine (2 mL) and acetic anhydride (2 mL), and *N,N*-dimethylaminopyridine (53 mg, 0.43 mmol) was added. The reaction mixture was stirred at room temperature for 2 h, after which time TLC (pentane ethyl/acetate, 4:1) showed complete conversion of the starting material (R_f 0.3) into a single product (R_f 0.6). The reaction mixture was cooled to 0 °C and methanol (1.5 mL) was slowly added. The solvent was concentrated under reduced pressure, diluted with ethyl acetate (20 mL) and washed with 0.1 M HCl until acidic pH and with saturated aqueous solution of sodium bicarbonate (25 mL). The organic phase was concentrated under reduced pressure and the residue was purified by flash chromatography (pentane/ethyl acetate, 9:1) to afford **9** (546 mg, 95%).

Synthesis of galactose diols:

Tetrabenzyl galactose **16** (1.6 g, 2.9 mmol) was dissolved in anhydrous THF (5 mL) and cooled to 0° C under argon. Vinylmagnesium bromide (10.5 mL, 0.7 M in THF, 7.4 mmol) was slowly added to the suspension and the reaction mixture was stirred under argon atmosphere at room temperature. After 12 h, TLC (toluene/ethyl acetate, 8:1) showed starting material (R_f 0.25), and the formation of a minor (R_f 0.25) and a major product (R_f 0.20). Saturated aqueous NH₄Cl (3 mL) was added and the mixture was diluted with ethyl acetate (25 mL) and washed with brine (15 mL). The ^1H NMR spectrum of the crude material showed a diasteromeric ratio of 2:1 of the epimeric diols. Purification by repeated flash chromatography (toluene/ethyl acetate, 10:1) gave minor diasteromeric diol **17** (523 mg, 32%), and major diasteromeric diol **18** (884 mg, 53%).

Tetrahydrofuran **4** (100 mg, 0.21 mmol) was dissolved in dichloromethane (3 mL), and Grubbs II generation catalyst (5 mg, 0.006 mmol) and then 1-Octene (200 μ L, 1.27 mmol) were added. The mixture was stirred under reflux for 8 h, after which time TLC (pentane/ethyl acetate 4:1) showed complete conversion of the starting material (R_f 0.2) into a single product (R_f 0.3). Evaporation of the solvent and purification of the residue by flash column chromatography (pentane/ethyl acetate 80:20) gave compound **30** (102 mg, 89%).
