## Supplementary Information

### General Methods

*n*-Hexane and furan was distilled from sodium/benzophenone. All synthetic work was carried out under an inert argon atmosphere using standard Schlenk techniques.  $Mg(CH_2SiMe_3)_2$  was prepared from the Grignard reagent  $(Me_3SiCH_2)MgCl$  by manipulation of the Schlenk equilibrium via the dioxane precipitation method. The resultant off white solid was purified via sublimation at 175°C ( $10^{-2}$  torr) to furnish pure  $Mg(CH_2SiMe_3)_2$ . Elemental analyses were attempted using a Perkin Elmer 2400 elemental analyzer however, due to the extreme air-sensitivity of compounds **3** and **4** satisfactory analyses could not be obtained.

### Synthesis of $[(TMEDA)Na(CH_2SiMe_3)(TMP)Mg(TMP)]_3$

TMPH (0.36mL, 2mmol) was added to a suspension of BuNa (0.08g, 1mmol) in dry *n*-hexane (20mL) and the resultant mixture was allowed to stir at room temperature for 1 h.  $Mg(CH_2SiMe_3)_2$  (0.2g, 1mmol) and TMEDA (0.15mL, 1mmol) was added to give a light yellow/orange solution and the resultant solution was allowed to stir for 12 hrs at room temperature. The reaction mixture was filtered and subsequent removal of the solvent *in vacuo* gave a crop of large colourless crystals (0.1g, 19%).

### Crystallographic Data

Table 1: Selected bond lengths and bond angles of Compound **3**

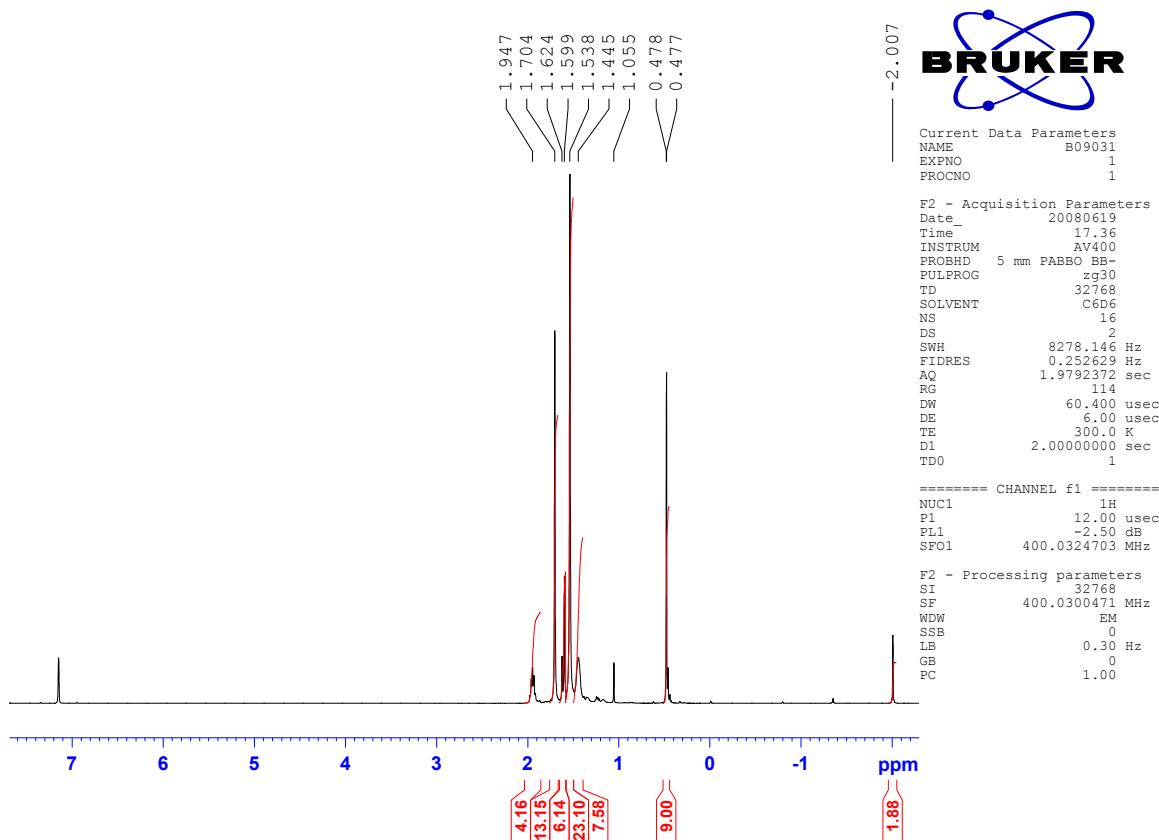

Selected Bond lengths Å	Selected Bond Angles °
Mg1-C1	2.179(2)
Mg1-N2	1.9895(18)
Mg1-N3	2.068(3)
Na1-N3	2.454(4)
Na1-C1	2.678(2)
Na1-N4	2.433(2)
Na1-N5	2.488(3)
	<b>N3-Mg1-N2</b> 128.70(14)
	<b>N3-Mg1-C1</b> 106.67(13)
	<b>N2-Mg1-C1</b> 123.36(10)
	<b>N3-Na1-C1</b> 83.08(9)
	<b>N3-Na1-N5</b> 138.90(13)
	<b>N3-Na1-N4</b> 139.70(12)
	<b>C1-Na1-N5</b> 100.81(12)
	<b>C1-Na1-N4</b> 115.48(10)
	<b>N5-Na1-N4</b> 75.48(12)

Data for **3** were measured on a Nonius Kappa CCD instrument and for **4** on an Oxford Diffraction Xcalibur S. Both datasets were measured at 123K with graphite monochromated Mo<sub>K</sub> $\alpha$  radiation ( $\lambda = 0.71073 \text{ \AA}$ ). All non-H atoms were refined anisotropically – except where disorder precluded this. Brief details are given below – with full data available in cif format.

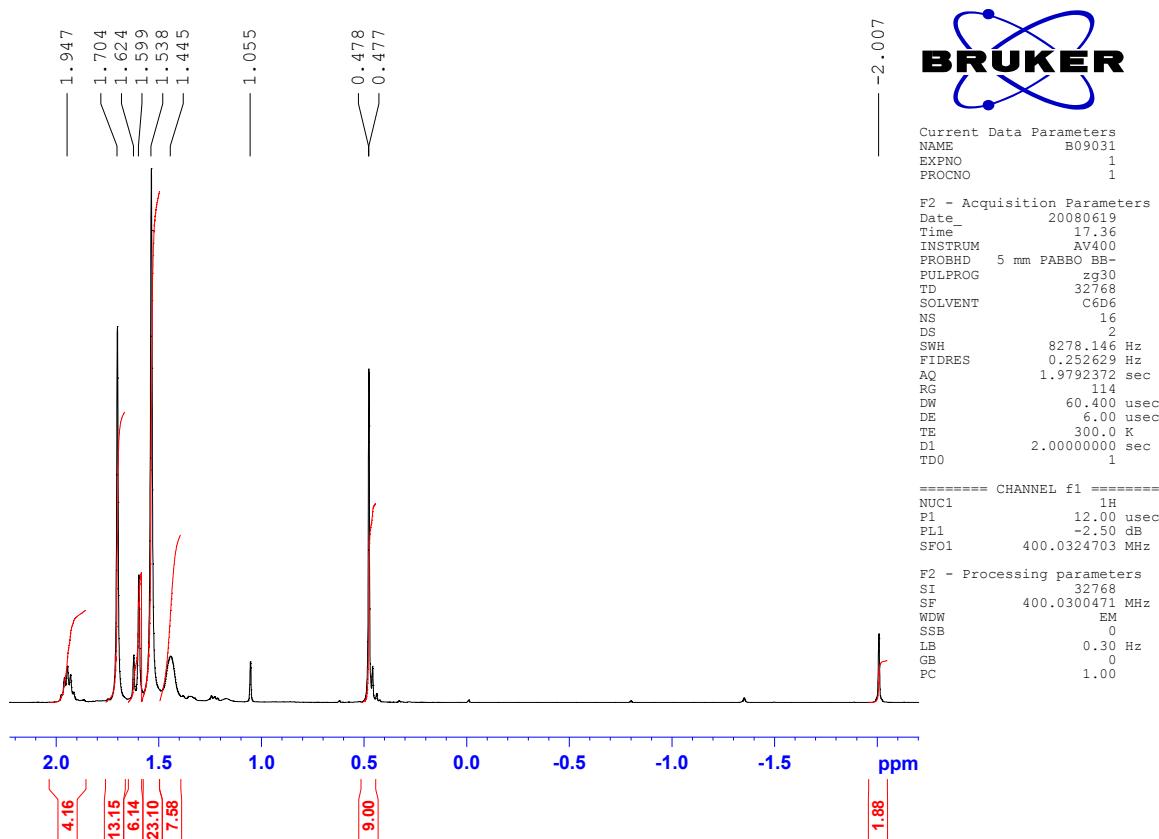

Crystal data for **3**: C<sub>28</sub>H<sub>63</sub>Mg<sub>1</sub>N<sub>4</sub>Na<sub>1</sub>Si<sub>1</sub>,  $M_r = 531.21$ , orthorhombic, space group Pna2<sub>1</sub>,  $a = 14.8470(2)$ ,  $b = 19.3771(3)$ ,  $c = 12.0280(4) \text{ \AA}$ ,  $V = 3460.34(14) \text{ \AA}^3$ ,  $Z = 4$ ,  $\lambda = 0.71073 \text{ \AA}$ ,  $\mu = 0.119 \text{ mm}^{-1}$ ,  $T = 123 \text{ K}$ ; 7665 reflections; final refinement to convergence on  $F^2$  gave  $R = 0.0495$  ( $F$ , 6037 obs. data only) and  $R_w = 0.1210$  ( $F^2$ , all data), GOF = 1.048. The bridging TMP ligand was modeled as disordered over two sites using SADI and SAME restraints. Refined occupancy 0.85(5):0.15(5).

Crystal data for **4**: C<sub>108</sub>H<sub>160</sub>Mg<sub>6</sub>N<sub>12</sub>Na<sub>12</sub>O<sub>16</sub>Si<sub>2</sub>,  $M_r = 2360.40$ , triclinic, space group P  $\overline{1}$ ,  $a = 15.5127(6)$ ,  $b = 16.7993(7)$ ,  $c = 17.7608(8) \text{ \AA}$ ,  $\alpha = 61.930(5)$ ,  $\beta = 73.749(4)$ ,  $\gamma = 63.757(4)^\circ$ ,  $V = 3648.0(3) \text{ \AA}^3$ ,  $Z = 1$ ,  $\lambda = 0.71073 \text{ \AA}$ ,  $\mu = 0.140 \text{ mm}^{-1}$ ,  $T = 123 \text{ K}$ ; 21042 reflections, 12205 unique,  $R_{\text{int}} = 0.0234$ ; final refinement to convergence on  $F^2$  gave  $R = 0.0565$  ( $F$ , 7447 obs. data only) and  $R_w = 0.1662$  ( $F^2$ , all data), GOF = 0.969. One TMEDA, two furans and a Na atom are modeled as disordered, each over two sites with site occupancies set to 0.5. The program SQUEEZE was implemented in PLATON to remove the equivalent of 8 electrons from solvent accessible voids totaling 561  $\text{ \AA}^3$ . The chemical identity of this “solvent” was not apparent.

**<sup>1</sup>H NMR (400MHz, d<sub>6</sub>-benzene, 300K):** δ 1.95 (q, 4H,  $\gamma$ -CH<sub>2</sub>, TMP) 1.70 (12H, CH<sub>3</sub>, TMEDA), 1.60 (s, 4H, CH<sub>2</sub>, TMEDA), 1.52 (s, 24H, CH<sub>3</sub> TMP), 1.44 (s (br),  $\beta$ -CH<sub>2</sub>, TMP), 0.48 (s, 12H, CH<sub>3</sub> CH<sub>2</sub>SiMe<sub>3</sub>), -2.00 (s, 2H, CH<sub>2</sub>, CH<sub>2</sub>SiMe<sub>3</sub>).

### Synthesis of [{(TMEDA)<sub>3</sub>Na<sub>6</sub>Mg<sub>3</sub>(CH<sub>2</sub>SiMe<sub>3</sub>)(2,5-C<sub>4</sub>H<sub>2</sub>O)<sub>3</sub>(2-C<sub>4</sub>H<sub>3</sub>O)<sub>5</sub>}<sub>3</sub>] 4

TMPH (0.36mL, 2mmol) was added to a suspension of BuNa (0.08g, 1mmol) in dry n-hexane (20mL) and the resultant mixture was allowed to stir at room temperature for 1h. Mg(CH<sub>2</sub>SiMe<sub>3</sub>)<sub>2</sub> (0.2g, 1mmol), TMEDA (0.15mL, 1mmol) and furan (0.07mL, 1mmol) was added. The resultant cloudy solution was gently heated for 5 mins and allowed to cool to room temperature depositing a crop of large colourless crystals (0.07g, 48%).

On repeating the reaction but allowing the solution to stir at room temperature for 12hrs, a white solid can be isolated as the title compound in a higher yield (0.11g, 75%).

### Deuterium Quench of Compound 4:

To a  $\text{d}_8\text{-THF}$  NMR sample of Compound 4 we added a drop of  $\text{D}_2\text{O}$  to quench the metallated furans. From this we expected to see two products Furyl A and Furyl B.

From the molecular formula of Compound 4 we would expect 10 of Furyl A and 6 of Furyl B. In both Furys A and B the protons labelled  $\text{H}_2$  and  $\text{H}_3$  come at the same chemical shift and are thus equivalent. Furyl A would have 20 protons in total from  $\text{H}_2$  and  $\text{H}_3$ , while Furyl B would have 10 protons from  $\text{H}_2$  and  $\text{H}_3$ , giving a total of 32 protons. Furyl A also has another proton  $\text{H}_1$ , which is not present in Furyl B so would be

expected to come as a separate signal in the spectrum. The overall integrals of 32:10 equating to 3.2:1 would be expected and indeed can be seen in the spectrum below.
