General Remarks

All manipulations were carried out under an atmosphere of dry, O₂-free N₂ employing an Innovative Technology glove box and a Schlenk vacuum-line. Solvents were purified either by employing a Grubbs-type column system manufactured by Innovative Technology and dispensed into thick-walled Schlenk glass bombs equipped with Young-type teflon valve stopcocks (hexanes, toluene, CH₂Cl₂), or were dried over the appropriate agents and distilled into the same kind of Young bombs (C₆H₅Br). All solvents were thoroughly degassed after purification (repeated freeze-pump-thaw cycles). Deuterated solvents were dried over the appropriate agents, vacuum-transferred into Young bombs and degassed accordingly (C₆D₅Br, CD₂Cl₂). When intended to be used in the glove box, all solvents were transferred through the antechambers in bombs with evacuated headspaces, and refilled inside into brown glass bottles equipped with 4 Å molecular sieves (small pieces of silver foil were further added to CH₂Cl₂ and CD₂Cl₂). ¹H, ¹¹B, ¹³C, ¹⁹F and ³¹P NMR spectra were recorded at 25 °C on Varian 300 and 400 MHz spectrometers, and were referenced using (residual) solvent resonances relative to SiMe₄ (¹H, ¹³C) or relative to an external standard [¹¹B: (Et₂O)BF₃; ¹⁹F: CFCl₃; ³¹P: 85% H₃PO₄]. In some instances, signal and/or coupling assignment was derived from two-dimensional NMR experiments. Chemical shifts are reported in ppm and coupling constants as scalar values in Hz. Combustion analyses were performed in house employing a Perkin-Elmer CHN Analyzer.

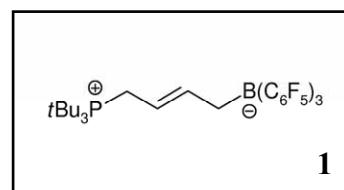

Starting Materials

t-Bu₃P (10 wt.% solution in hexanes) was obtained from Strem Chemicals, Inc. (USA) and used as received. B(C₆F₅)₃ was a generous gift from NOVA Chemicals Corp. (Canada), and was doubly sublimed before use. Dienes were purchased from Aldrich or Alfa Aesar. 1,3-Butadiene was purified immediately prior to use by condensing a few mL from the reservoir lecture bottle into a thick-walled Young glass bomb cooled to -196 °C that contained CaCl₂ pellets. After thorough evacuation at that temperature to remove trace gas impurities, the bomb was closed and left stirring for 1 h at -20 °C. It was then connected to the reaction glass bomb (cooled to -196 °C) and the dry 1,3-butadiene vacuum-transferred by immersing the drying glass bomb into a cold water bath. 2,3-Dimethyl-1,3-butadiene and 1,3-cyclohexadiene were purified by stirring over CaCl₂ pellets, followed by vacuum transfer and degassing (repeated freeze-pump-thaw cycles). 2,3-Diphenyl-1,3-butadiene was recrystallized from hexanes at -35 °C and dried *in vacuo*.

Syntheses

In all cases, the FLP combination [*t*-Bu₃P/B(C₆F₅)₃] was prepared in the glove box by adding *t*-Bu₃P (0.60 mL or 408 mg of a 10 wt.% solution in hexanes; 40.8 mg, 202 μmol) to solid B(C₆F₅)₃ (102 mg, 200 μmol) in a glass vial. For use outside of the glove box, the resulting yellow mixture was transferred with toluene (2 mL) into a teflon-valve Young reaction bomb equipped with a stir bar.

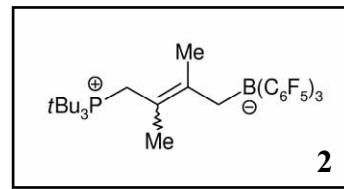

(*E*)-{[*t*-Bu₃P]CH₂CH=CHCH₂[B(C₆F₅)₃]} (**1**). A Young reaction bomb charged with [*t*-Bu₃P/B(C₆F₅)₃] (200 μmol) in toluene/hexanes (6 mL/0.6 mL) was cooled to -196 °C. A second, closed (!) Young bomb (cooled to -20 °C) containing dry 1,3-butadiene (~ 2 mL) was connected via a vacuum transfer bridge having a Schlenk gas adapter. As all liquid in the first bomb was frozen, its Teflon valve was opened and

the FLP solution degassed for 15 min. The gas adapter was closed, the -20 °C cooling bath of the second bomb replaced by a cold water bath, and its Teflon valve opened carefully to transfer the 1,3-butadiene. The first bomb was then closed and its liquid N₂ cooling bath removed. While the reaction mixture was melting, its yellow color discharged instantly, and a colorless solid started forming. Stirring was continued for 5 min at room temperature,

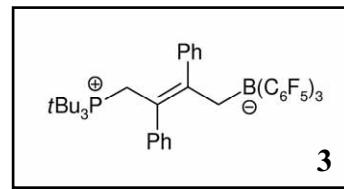

then the solvents and excess diene were removed *in vacuo*, leaving an off-white residue. The Young reaction bomb was taken back into the glove box, and the solid transferred with CH₂Cl₂ (2 mL) into a glass vial. The solution was concentrated *in vacuo* to ~2 mL, and hexanes (5 mL) was added dropwise with stirring to yield a colorless precipitate. The supernatant was removed with a pipette, the powdery solid swirled up in hexanes (1 mL) and allowed to settle at -35 °C for 1 h, the supernatant carefully removed and the solid dried *in vacuo*. Yield 94 mg (122 μmol, 61%). ¹H NMR (CD₂Cl₂): 6.03 (dm, 1 H, ³J_{HC=CH-trans} = 15.2, PCH₂CH=CHCH₂B), 5.92 (dm, 1 H, ³J_{HC=CH-trans} = 15.2, PCH₂CH=CHCH₂B), 4.23 (br ddd, 2 H, ²J_{HP} ≈ ³J_{HH} ≈ 4, ⁴J_{HH-allyl} = 1.6, PCH₂CH=CHCH₂B), 2.99 (dq₁₁₁₁, 2 H, ²J_{HB} = 6.7, ³J_{HH} = 1.2, PCH₂CH=CHCH₂B), 1.59 [d, 27 H, ³J_{HP} = 14.0, C(CH₃)₃]. ¹H NMR (C₆D₅Br): 5.74 (dm, 1 H, ³J_{HC=CH-trans} = 15.0, PCH₂CH=CHCH₂B), 5.49 (dm, 1 H, ³J_{HC=CH-trans} = 15.0, PCH₂CH=CHCH₂B), 4.28 (br s, 2 H, PCH₂CH=CHCH₂B), 2.24 (br q₁₁₁₁, 2 H, ²J_{HB} = 6.7, PCH₂CH=CHCH₂B), 0.95 [d, 27 H, ³J_{HP} = 14.0, C(CH₃)₃]. ¹¹B{¹H} NMR (CD₂Cl₂): -2.0. ¹³C NMR (CD₂Cl₂, partial): 148.5 (br dm, ¹J_{CF} ≈ 240, *o*-CF), 138.9 (br dm, ¹J_{CF} ≈ 245, *p*-CF), 138.6 (br dd, ¹J_{CH} ≈ 160, ²J_{CP} = 11, PCH₂CH=CHCH₂B), 137.0 (br dm, ¹J_{CF} ≈ 245, *m*-CF), 123.6 (very br, *ipso-C*), 118.4 (br dd, ¹J_{CH} ≈ 160, ³J_{CP} = 8, PCH₂CH=CHCH₂B), 40.1 [d, ¹J_{CP} = 28, C(CH₃)₃], 30.0 [qm, ¹J_{CH} = 129, C(CH₃)₃]. ¹⁹F NMR (CD₂Cl₂): -130.2 (d, ³J_{FF} = 18.0, *o*-CF), -163.6 (t, ³J_{FF} = 20.0, *p*-CF), -167.7 (dd, ³J_{FF} ≈ ³J_{FF} = 19.0, *m*-CF). ³¹P{¹H} NMR (CD₂Cl₂): 47.6. Elemental anal. calcd. for C₃₄H₃₃BF₁₅P: C 53.15, H 4.33; found C 52.91, H 4.41.

(*E/Z*)-{[*t*-Bu₃P][CH₂C(CH₃)=C(CH₃)CH₂][B(C₆F₅)₃]} (**2**). In the glove box, [*t*-Bu₃P/B(C₆F₅)₃] (200 μmol) in hexanes (0.6 mL), pre-mixed in a glass vial, was diluted with toluene (5 mL) to give a light yellow solution, which was then stored at -35 °C for 15 min. In the meantime, a solution of 2,3-dimethyl-1,3-butadiene (~0.2 mL, ~160 mg, ~10 eq.) in toluene (1 mL) was prepared. The FLP solution was taken out of the freezer and treated dropwise with the diene solution with stirring, whereby the yellow color vanished quickly and an off-white precipitate started forming. Stirring was continued for 2 h, then the reaction mixture was cooled to -35 °C overnight. The supernatant was removed with a pipette, the remaining solid washed with cold hexanes (2 mL) and then dried *in vacuo*. The solid was redissolved in CH₂Cl₂ (3 mL), and hexanes (5 mL) was added dropwise with stirring, yielding a colorless precipitate. The supernatant was removed

with a pipette and the solid dried *in vacuo*. Yield 108 mg (136 μmol , 68%). Crystals suitable for XRD measurements were grown from cooling a saturated CH_2Cl_2 solution layered with hexanes to -35°C for several days. ^1H NMR (CD_2Cl_2): 3.04 [br, 2 H, $\text{PCH}_2\text{C}(\text{CH}_3)=\text{C}(\text{CH}_3)\text{CH}_2\text{B}$], 2.49 [br, 2 H, $\text{PCH}_2\text{C}(\text{CH}_3)=\text{C}(\text{CH}_3)\text{CH}_2\text{B}$], 1.69 [br, 3 H, CH_3], 1.59 [d, 27 H, $^3J_{\text{HP}} = 14$, $\text{C}(\text{CH}_3)_3$, minor isomer], 1.56 [d, 27 H, $^3J_{\text{HP}} = 14$, $\text{C}(\text{CH}_3)_3$, major isomer], 1.49 [br, 3 H, CH_3]. $^{11}\text{B}\{\text{H}\}$ NMR (CD_2Cl_2): -13.2. $^{13}\text{C}\{\text{H}\}$ NMR (CD_2Cl_2 , partial): 148.8 (br dm, $^1J_{\text{CF}} = 238$, *o*-CF), 148.6 [d, $^2J_{\text{CP}} = 12.0$, $\text{PCH}_2\text{C}(\text{CH}_3)=\text{C}(\text{CH}_3)\text{CH}_2\text{B}$, major isomer], 148.3 [d, $^2J_{\text{CP}} = 11.2$, $\text{PCH}_2\text{C}(\text{CH}_3)=\text{C}(\text{CH}_3)\text{CH}_2\text{B}$, minor isomer], 138.4 (br dm, $^1J_{\text{CF}} = 244$, *p*-CF), 137.0 (br dm, $^1J_{\text{CF}} = 248$, *m*-CF), 126.8 (very br, *ipso*-C), 110.9 [d, $^3J_{\text{CP}} \approx 10$, $\text{PCH}_2\text{C}(\text{CH}_3)=\text{C}(\text{CH}_3)\text{CH}_2\text{B}$, minor], 109.9 [d, $^3J_{\text{CP}} = 10.5$, $\text{PCH}_2\text{C}(\text{CH}_3)=\text{C}(\text{CH}_3)\text{CH}_2\text{B}$, major], 40.7 [d, $^1J_{\text{CP}} = 25.7$, $\text{C}(\text{CH}_3)_3$, minor], 40.5 [d, $^1J_{\text{CP}} = 25.7$, $\text{C}(\text{CH}_3)_3$, major], 30.7 [s, $\text{C}(\text{CH}_3)_3$, minor], 30.6 [s, $\text{C}(\text{CH}_3)_3$, major], 25.1 [d, $^3J_{\text{CP}} = 29.2$, $\text{PCH}_2\text{C}(\text{CH}_3)=\text{C}(\text{CH}_3)\text{CH}_2\text{B}$, minor], 23.6 [d, $^3J_{\text{CP}} = 29.2$, $\text{PCH}_2\text{C}(\text{CH}_3)=\text{C}(\text{CH}_3)\text{CH}_2\text{B}$, major], 21.7 [d, $^4J_{\text{CP}} = 0.8$, $\text{PCH}_2\text{C}(\text{CH}_3)=\text{C}(\text{CH}_3)\text{CH}_2\text{B}$, major], 20.8 [d, $^4J_{\text{CP}} = 0.8$, $\text{PCH}_2\text{C}(\text{CH}_3)=\text{C}(\text{CH}_3)\text{CH}_2\text{B}$, minor]. ^{19}F NMR (CD_2Cl_2): -131.4 (d, $^3J_{\text{FF}} = 20.0$, *o*-CF, major isomer), -131.7 (d, $^3J_{\text{FF}} = 18.0$, *o*-CF, minor isomer), -164.3 (t, $^3J_{\text{FF}} = 20.5$, *p*-CF, major), -164.7 (t, $^3J_{\text{FF}} = 20.5$, *p*-CF, minor), -167.6 (t, $^3J_{\text{FF}} \approx 3^3J_{\text{FF}} = 19.0$, *m*-CF, major), -168.0 (t, $^3J_{\text{FF}} \approx 3^3J_{\text{FF}} = 19.5$, *m*-CF, minor). $^{31}\text{P}\{\text{H}\}$ NMR (CD_2Cl_2): 51.9 (major isomer), 51.7 (minor isomer). Elemental anal. calcd. for $\text{C}_{36}\text{H}_{37}\text{BF}_{15}\text{P}$: C 54.29, H 4.68; found C 54.01, H 4.33.

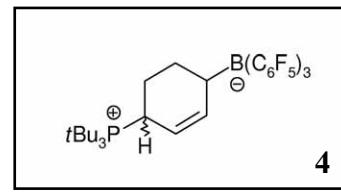

(*E*)-{[*t*-Bu₃P][CH₂C(C₆H₅)=C(C₆H₅)CH₂][B(C₆F₅)₃]} (**3**). In the glove box, [*t*-Bu₃P/B(C₆F₅)₃] (200 μmol) in hexanes (0.6 mL), pre-mixed in a glass vial, was diluted with toluene (5 mL) to give a light yellow solution, which was then stored at -35°C for 15 min. In the meantime, a solution of 2,3-diphenyl-1,3-butadiene (42 mg, 204 μmol) in toluene (2 mL) was prepared. The FLP solution was taken out of the freezer and treated dropwise with the diene solution with stirring. After stirring overnight, all volatiles were removed *in vacuo*, leaving a light yellow gum. The residue was redissolved in CH_2Cl_2 (3 mL), and hexanes (5 mL) was added dropwise with stirring to yield an off-white precipitate. The supernatant was removed with a pipette, and the solid washed repeatedly by swirling it up in hexanes (1 mL), allowing it to settle at -35°C for 1 h, and removing the supernatant with a pipette. The powdery white solid was finally dried *in vacuo*. Yield 94 mg (102 μmol , 51%). ^1H NMR (CD_2Cl_2): 6.98 - 7.07 [m, 3 H,
