Synthesis of Reagents

2,4-Dinitrophenyl 3,4,6-tri-O-acetyl-2-deoxy-2-fluoro- β -D-mannopyranoside

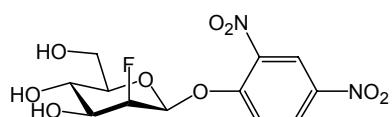

3,4,6-Tri-O-acetyl-D-glucal (5.62 g, 20.6 mmol) was dissolved in 3:1 DMF / H₂O (200 mL) followed by Selectfluor™ (10.5 g, 29.7 mmol, 1.4 eq.) and the whole mixture stirred overnight at 50°C. TLC analysis (1:1 PE/EtOAc) indicated complete conversion of the D-glucal to 2-deoxy-2-fluoro hexopyranoses at this time. The solvent was evaporated and the residue redissolved in EtOAc (300 mL), washed with brine and water, and then dried over MgSO₄. The solvent was evaporated and the crude, without further purification, re-dissolved in DMF (200 mL). DABCO (7.0 g, 62.4 mmol, ~ 3 eq.) was added and dissolved, followed by 2,4-dinitrofluorobenzene (6.0 g, 32.2 mmol, ~ 1.5 eq.). The vessel was purged with argon and stirred in the dark overnight at room temperature, whereupon TLC analysis (3:4 EtOAc / PE) indicated complete conversion to 2,4-dinitrophenyl 2-deoxy-2-fluoro-glycosides. The solvent was evaporated and the residue redissolved in EtOAc (300 mL). The solution was washed with 0.2 M H₂SO₄, saturated sodium bicarbonate and water. The organic layer was then dried over MgSO₄ then evaporated to afford a dark brown oil. Chromatography on silica gel (4:3 to 1:1 EtOAc / PE) and evaporation of the solvent afforded the alpha (1.49 g, 3.13 mmol, 15.1%) and beta (1.55 g, 3.26 mmol, 15.7%, $\beta/\alpha = 1:1$) anomers of the protected 2,4-dinitrophenyl 2-fluoro-mannosides, and an anomeric mixture of the protected 2,4-dinitrophenyl 2-fluoro-glucosides (2.58 g, 5.43 mmol, 26%, $\beta/\alpha = 3.7:1$ by ¹⁹F NMR) as pale yellow crystalline solids. ¹H and ¹⁹F NMR spectral data matched that reported previously (Ref 1S).

2,4-Dinitrophenyl 2-deoxy-2-fluoro- β -D-mannopyranoside

The per-O-acetate (1.69 g, 3.57 mmol) was suspended in dry MeOH (50 mL) and cooled to 0°C under argon. Acetyl chloride (2 mL) was added dropwise to afford a 4% solution of HCl. The mixture was stirred for 2 days at 4°C. The solvent was evaporated followed by repeated evaporation of dry diethyl ether from the residue to remove excess HCl. The crude was columned on silica gel (95:5 EtOAc/MeOH). Subsequent evaporation of the solvent and recrystallization of the residue from acetone / PE to afforded white needles (1.08 g, 3.10 mmol, 87%).
