Experimental details

Chemicals: [1,2-¹³C₂]NaOAc (99% isotopic enrichment) was purchased from Eurisotop (Saarbrücken, Germany).

Biological material and sterile culture: *Streptomyces* strain AK 671 was isolated from a pine forest soil collected at Hamsterley Forest, County Durham, UK. The almost complete 16S rRNA gene sequence of strain AK 671 was compared with corresponding sequences of representatives of the genus *Streptomyces*. The resulting data indicated that the organism forms a distinct phyletic line in the 16S rRNA *Streptomyces* gene tree and hence probably belongs to a new species.

Culture conditions: Fermentations of the strain were performed in a 500-mL fermenter equipped with a magnetic stirrer agitation system (home made) at 800 rpm and an aeration rate of 0.5 vvm at 27 °C in a medium consisting of (per litre tap water) starch soluble 10 g, glucose 10 g, glycerol 10 g, cornsteep powder 2.5 g (Marcor), Bacto peptone 5 g, yeast extract 2 g (Ohly Kat), NaCl 1 g, and CaCO₃ 3 g; pH was adjusted to 7.3 prior to sterilization. The fermenter was inoculated with 5 vol-% of a shake flask culture grown in the same medium for 72 h.

Feeding experiments and isolation of labeled 1b: Feeding started after 39 h of incubation. A sterile-filtered solution of 500 mg of ¹³C₂-labeled acetate, dissolved in 20 mL H₂O, adjusted to pH 7.0, was fed continuously over a period of 10 h. After an incubation period of 160 h in total, the culture broth was centrifuged, the biomass discarded, and the supernatant (350 mL) was applied to an Amberlite XAD-16 column (1.5 × 30 cm). After washing the column with H₂O, chrysophanol glucuronide (**1b**) was desorbed with H₂O–MeOH (6:4). After concentration to the aqueous residue *in vacuo* and adjusting to pH 2.0, **1b** was extracted with 1-BuOH. Compound **1b** was obtained in a pure form in a yield of 11 mg by chromatography on Sephadex LH-20 (1.5 × 90 cm) using MeOH as the eluent. The spectroscopic data and chromatographic properties of **1b** were in full accordance with those previously reported.^[14]

Feeding experiments and isolation of labeled 2a and 2b: Feeding started after 24 h of incubation. A sterile-filtered solution of 500 mg of ¹³C₂-labeled acetate, dissolved in 20 mL H₂O, adjusted to pH 7.0, was fed continuously over a period of 10 h. After an incubation period of 42 h in total, the culture broth was centrifuged, the biomass was discarded, and the supernatant (370

mL) was adjusted to pH 2.0 and extracted three times with EtOAc. Compounds **2a** and **2b** were obtained in a pure form in yields of 16 mg and 10 mg, respectively, by chromatography on Sephadex LH-20 (1.5 × 90 cm) using MeOH as the eluent. The spectroscopic data and chromatographic properties of **2a** and **2b** were in full accordance with those previously reported.^[14]

NMR spectroscopy: NMR spectra were recorded on a Bruker DMX 600 spectrometer. For calibration of ¹³C and ¹H chemical shifts, the methyl-carbon signal and the residual proton signal of the solvent were used, respectively (methanol-*d*₄: δ_H = 3.31 ppm and δ_C = 49.1 ppm). To establish ¹³C-¹³C connectivities, 2D INADEQUATE experiments were performed at 150.9 MHz using a carbon-sensitive cryoprobe.

Scheme S-1 Biosynthetic relationship of **2a**, its glucuronide **2b**, prechrysophanol **8a** and its glucuronide **8b**, and the final product, chrysophanol glucuronide (**1b**).

Table S-1. ^{13}C -NMR data of chrysophanol glucuronide (**1b**). ^{13}C NMR chemical shifts and enrichment ratios of labeled positions of **1b** isolated after feeding of $^{13}\text{C}_2$ -acetate. The enrichment is given as atom% ^{13}C exceeding the natural abundance.

Carbon	δ [ppm]	Enrichment [%]	2J (to C)
1	163.9	1.1	67.1 (2)
