

## Electronic Supplementary Information

### Exopolyhedral ligand flipping on isomerisation of novel supraicosahedral stannacarboranes

Peter D. Abram, David Ellis, Georgina M. Rosair and Alan J. Welch

#### 1. Synthetic Procedures

Synthesis of **1**: Sodium (0.19 g, 8.13 mmol) reduction of 1,12-Me<sub>2</sub>-1,12-*clos*o-C<sub>2</sub>B<sub>10</sub>H<sub>10</sub> (0.20 g, 1.16 mmol) in liquid ammonia (ca. 20 mL) at -78°C for 4 h yielded a dark blue solution. Removal of ammonia upon warming allowed the dry residue to be extracted into degassed THF (20 mL). The grey suspension was filtered into a Schlenk tube under nitrogen affording a clear solution, which was transferred via cannula to a THF (20 mL) solution of SnCl<sub>2</sub> (0.22 g, 1.16 mmol) frozen to -196°C. The mixture was slowly warmed to RT with stirring. Volatiles were removed in vacuo, DCM added, and the product filtered. The filtrate was evaporated to afford a white solid, recrystallised from DCM/petroleum ether to yield colourless crystals.

Yield 71 mg (21%). Mass spectrometry: *m/z* envelope centred on 289 (M<sup>+</sup>). Microanalysis: Theoretical; C 16.51, H 5.54. Found; C 16.30, H 5.64%. IR (DCM):  $\nu_{\text{max}}$  2552 cm<sup>-1</sup> (B-H). NMR data are given in the manuscript. Although there are fewer resonances in both the <sup>11</sup>B{<sup>1</sup>H} and {<sup>1</sup>H} spectra than might have been anticipated for a molecule with, in solution, effective C<sub>s</sub> symmetry, there is no feasible fluctational process that would afford a higher degree of symmetry. Certainly, in the analogous compound 1,10-Me<sub>2</sub>-4-η-C<sub>6</sub>H<sub>6</sub>-4,1,10-RuC<sub>2</sub>B<sub>10</sub>H<sub>10</sub> (Compound **10** in Welch, et al, *Chem. Commun.*, 2005, 1348) there are six <sup>11</sup>B signals in the ratio 2:2:1:1:2:2 and two CH<sub>3</sub> signals in the <sup>1</sup>H spectrum.

Synthesis of **2**: A stirring degassed toluene solution (5 mL) of Me<sub>2</sub>bipy (20 mg, 0.11 mmol) was treated with a toluene solution (10 mL) of **1** (30 mg, 0.10 mmol) at room temperature. A bright yellow precipitate formed instantaneously. Toluene was removed and the resulting solid washed with petroleum ether (2×10 mL) and dried in vacuo. Crystallisation from DCM/petroleum ether.

Yield 20 mg (42%). Microanalysis: Theoretical; C 40.44, H 5.94, N 5.89. Found; C 39.85, H 5.76, N 5.72%. IR (DCM):  $\nu_{\text{max}}$  2521 cm<sup>-1</sup> (B-H). Again, NMR data are given in the manuscript. It is possible that the Me<sub>2</sub>bipy ligand in **2** is flipping between alternative orientations in solution at room temperature (trans to C1 and trans to C10) but we have no evidence for that.

Synthesis of **3**: A degassed toluene solution (20 mL) of **1** was heated to reflux for 3 h. After cooling to RT the solution was filtered and the solvent removed. Following washing with petroleum ether (2×20 mL) and drying in vacuo, the product was afforded as a white solid.

Yield 288 mg (66%). Mass spectrometry: *m/z* envelope centred on 289 (M<sup>+</sup>). IR (DCM):  $\nu_{\text{max}}$  2544 cm<sup>-1</sup> (B-H).

Synthesis of **4**: A stirring degassed toluene solution (3 mL) of bipy (6 mg, 0.04 mmol) was treated with a toluene solution of **3** (10 mg, 0.03 mmol) at room temperature. A pale yellow precipitate formed instantaneously. Toluene was removed and the resulting solid washed with petroleum ether (2×10 mL) and dried in vacuo. Crystallisation from DCM/petroleum ether.

Yield 4 mg (30%).

#### 2. Additional Crystallographic Information

Intensity data were collected from single crystals on a Bruker X8 APEX2 diffractometer, with crystals mounted in inert oil on a cryoloop and cooled to 100 K by an Oxford Cryosystems Cryostream. Empirical absorption corrections were made using the program SADABS<sup>1</sup>. The

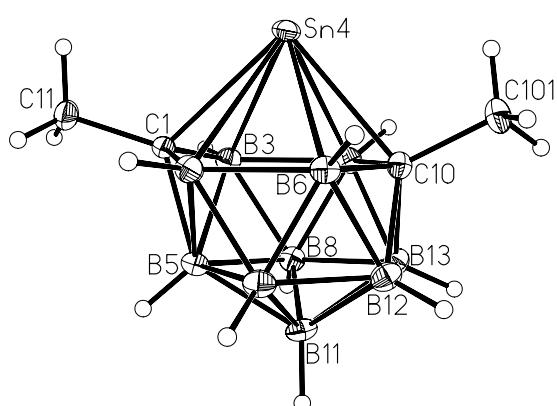

structures were solved by direct methods and refined by full-matrix least-squares using the SHELXTL program suite.<sup>2</sup> All non-hydrogen atoms were refined with anisotropic displacement parameters. In **2** there is rotational disorder of the methyl groups of the Me<sub>2</sub>bipy ligand and a partially disordered CH<sub>2</sub>Cl<sub>2</sub> of solvation. In **4** there is partial disorder in the cage, with a {CMe} unit being 67:33 in cluster vertices 12 and 13, respectively, complemented by {BH} being 33:67 at positions 12 and 13.

1 SADABS, V2.05; G. M. Sheldrick, University of Göttingen, Germany, 2005.

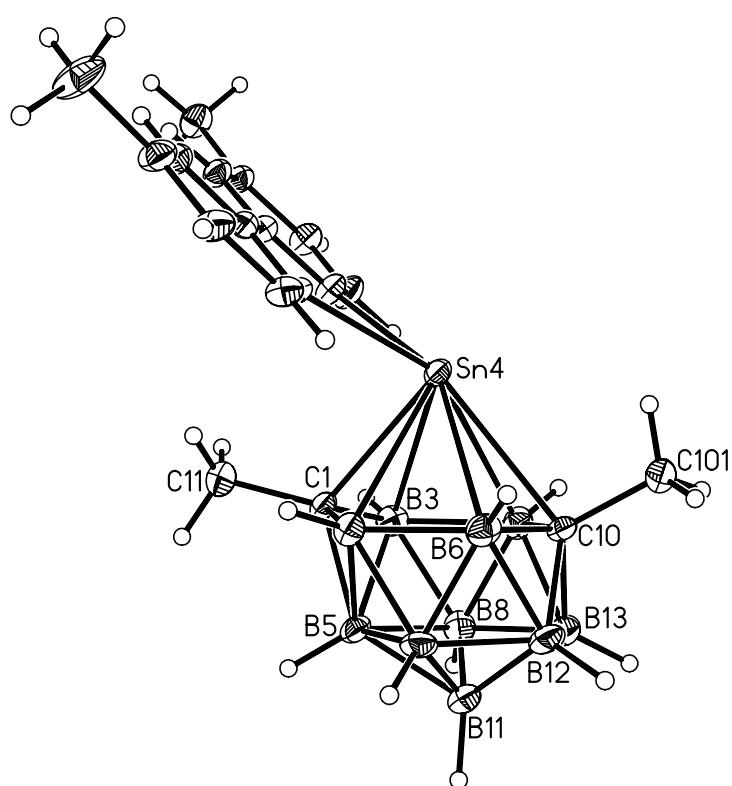

2 SHELXTL, V6.10; Bruker-AXS, Madison, WI, USA, 2000.

In the views below all non-H atoms are shown with 50% probability ellipsoids.
