General Experimental. Preparative chemistry was performed under a dry nitrogen atmosphere, unless noted otherwise. Catalytic reactions were generally performed in air, using a Radley's 12-place reaction carousel. NMR spectra were recorded on a Bruker AVANCE 400 MHz machine operating at 400 MHz for ${ }^{1} \mathrm{H}$ NMR and 100 MHz for ${ }^{13} \mathrm{C}$ NMR in $\mathrm{CDCl}_{3}$ at room temperature, unless otherwise stated. Melting points were recorded using an Electrothermal Gallenhamp apparatus, and were uncorrected. Infrared spectra were recorded using a Perkin Elmer 100 series FT-IR spectrometer, equipped with a beam-condensing accessory (samples were sandwiched between diamond compressor cells). MS were recorded on a Micromass Autospec Premier Spectrometer or a VG Platform II spectrometer using EI, CI or ESI techniques. Chiral HPLC were performed on a Gilson HPLC chromatograph equipped with a Daicel Chiralcel OJ-H column, where UV detection was attained at 254 nm .

Materials. Solvents were dried by passing through columns of molecular sieves in a solvent purification system. All precursors and reagents were used as received from commercial suppliers, unless otherwise stated. Lithium diisopropyl amide (LDA) was generated in situ from reaction of $n$-BuLi and diisopropylamine in THF at $-78^{\circ} \mathrm{C}$.

## Synthesis of terminal allenic alcohols:

2,2-Diphenylhexa-4,5-dien-1-ol, 1a. Synthesised in three steps using a modified procedure: ${ }^{1}$
(i) Propargylation: A solution of methyl 2,2-diphenylacetate ${ }^{2}(5.0 \mathrm{~g}, 22.1 \mathrm{mmol})$ in dry THF ( 20 mL ) was added dropwise ( 90 min ) to a solution of LDA ( 2 M in $\mathrm{THF}, 16.6 \mathrm{~mL}, 33.2 \mathrm{mmol}$ ), keeping the temperature below $-65^{\circ} \mathrm{C}$. Stirring was continued for 5 hours, before the addition of propargyl bromide ( $80 \%$ in toluene, 2.9 $\mathrm{mL}, 26.5 \mathrm{mmol}$ ). The reaction mixture was left to warm slowly to room temperature and stirred overnight. The resulting mixture was treated with sat. $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 50 \mathrm{~mL})$. The combined organic extracts were dried over $\mathrm{MgSO}_{4}$ and concentrated under vacuum. The residue was subjected to column chromatography to afford methyl 2,2-diphenylpent-4-ynoate, $\mathbf{S} 1$ as a pale yellow oil ( $3.0 \mathrm{~g}, 85 \%$ ). $\mathrm{R}_{\mathrm{f}}=0.38$ (hexanes: acetone, $30: 1$ ); $v_{\max }$ (thin film) $/ \mathrm{cm}^{-1}: 3317,3028,2992,1736,1466,1379,1229,1056,698 ; \delta_{\mathrm{H}}(400$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): 7.42-7.25(10 \mathrm{H}, \mathrm{m}), 3.77(3 \mathrm{H}, \mathrm{s}), 3.32(2 \mathrm{H}, \mathrm{d}, J=2.6), 1.95(1 \mathrm{H}, \mathrm{t}, J=2.6)$; $\delta_{\mathrm{C}}(100 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ): 173.8, 141.3, 128.8, 127.9, 127.3, 80.9, 71.8, 52.7, 29.3; m/z (EI): 264 ( $\mathrm{M}^{+}, 5 \%$ ), 225 (83 \%), 205 (100 \%).

The reaction mixture was refluxed for 24 hours, before cooling to room temperature and concentrated under vacuum. The residue was purified by column chromatography to furnish methyl 2,2 -diphenylhexa-4,5dienoate, $\mathbf{S 2}$ as a yellow oil ( $2.4 \mathrm{~g}, 43 \%$ ). $\mathrm{R}_{\mathrm{f}}=0.40$ (hexanes/ acetone, $40: 1$ ); $v_{\max }$ (thin film) $/ \mathrm{cm}^{-1}: 3089,3058$, $2950,1956,1731,1494,1445,1223,1202,1057,845,699 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.37-7.22(10 \mathrm{H}, \mathrm{m}), 4.95-$ $4.83(1 \mathrm{H}, \mathrm{m}) 4.48(1 \mathrm{H}, \mathrm{t}, J=2.5), 4.46(1 \mathrm{H}, \mathrm{t}, J=2.5), 3.73(3 \mathrm{H}, \mathrm{s}), 3.14(2 \mathrm{H}, \mathrm{dt}, J=2.5,7.7) ; \delta_{\mathrm{C}}(100$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): 210.1,174.4,142.2,129.0,127.9,126.9,85.8,73.8,60.6,52.4,38.1 ; \mathrm{m} / \mathrm{z}(\mathrm{CI}): 296\left(\left[\mathrm{MNH}_{4}\right]^{+}\right.$, 100\%), 279 ([MH] ${ }^{+}, 26 \%$ ), 219 ( $22 \%$ ).

## Typical procedure for catalytic reactions:

A Radley's reaction tube was charged with a magnetic stir bar, the catalyst $\operatorname{AgOTf}, \mathrm{Sn}(\mathrm{OTf})_{2}$ or $\mathrm{Zn}(\mathrm{OTf})_{2}(0.06$ $\mathrm{mmol})$ and the corresponding $\gamma$-allenic alcohol ( $\mathbf{1 a}, \mathbf{1 b}$ or $\mathbf{1 c}$ ) ( 0.4 mmol ). A PTFE screwcap was fitted, and DCE $(0.3 \mathrm{~mL})$ was added to the contents of the tube via syringe through the rubber septum. The tube was then positioned in a reaction carousel, and left to stir at room temperature. Conversions were monitored by TLC and/or NMR integration. Upon completion, the solvent was evaporated and the residue purified by column chromatography (hexanes/EtOAc, 20:1).

The absolute structure of $\mathbf{3}$ could not be determined by either $R$-factor tests $\left[R_{1}^{+}=0.0497, R_{1}^{-}=0.0497\right]$ or by use of the Flack parameter $\left[x^{+}=+0(3), x^{-}=+1(3)\right] . \operatorname{CCDC726110}$.

CCDC726111.

The crystals of $\mathbf{4}$ and $\mathbf{5}$, neither of which contains any atoms heavier than oxygen, both grew as thin needles. It was not surprising, therefore, that they were both weak scatterers of X-rays, and this led to the data collections being trimmed to $45^{\circ}$ and $120^{\circ}$ in $2 \theta$ for $\mathbf{4}$ and $\mathbf{5}$ respectively. Compound $\mathbf{4}$ crystallised in a polar space group, $P n a 2_{1}$ (no. 33), but it proved impossible to determine the correct absolute structure, which was not surprising given the lack of any atoms heavier than oxygen and the use of $\mathrm{Mo}-\mathrm{K} \alpha$ radiation. The terminal $\mathrm{C}(11)=\mathrm{C}(12)=\mathrm{C}(13)$ unit in the structure of $\mathbf{5}$ was found to be disordered. Two orientations were identified of ca. 80 and $20 \%$ occupancy, and the equivalent bond lengths and angles of the two orientations were lightly restrained to be equal. Only the non-hydrogen atoms of the major occupancy orientation were refined anisotropically. The positions of the $\mathrm{C}(13)$ and $\mathrm{C}\left(13^{\prime}\right)$ protons in the structure of $\mathbf{5}$ were calculated on the basis of trigonal planar geometries at $\mathrm{C}(13)$ and $\mathrm{C}\left(1^{\prime}\right)$, and the assumption that these planes would be coplanar with the $\mathrm{C}(10)-\mathrm{C}(11)$ bond. Once placed, these protons were allowed to ride on their parent atoms.
