## Experimental

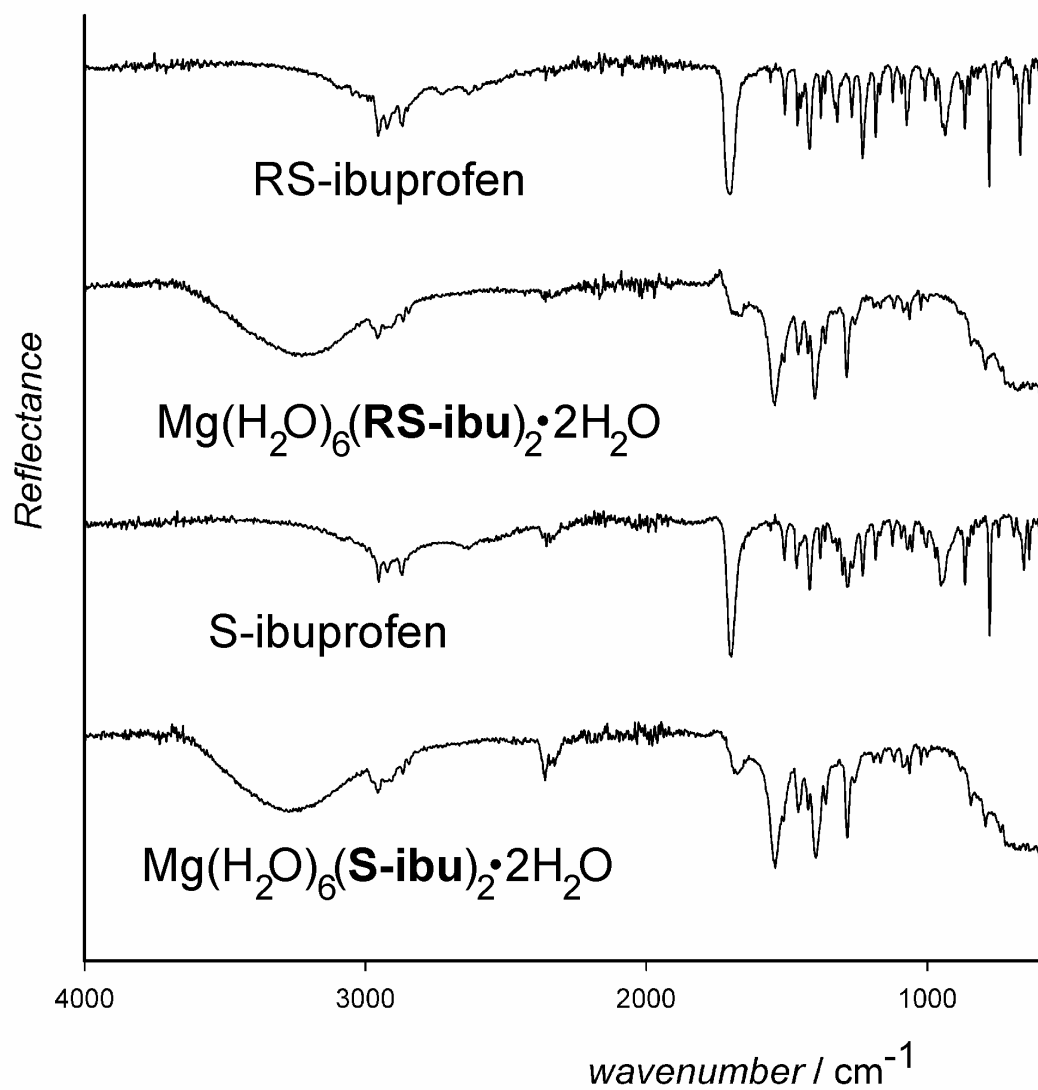

**Mechanochemical experiments** All chemicals were commercially available from the Sigma-Aldrich Company. Magnesium oxide was calcined at 600 °C before use, and the crown ether **15c5** was kept over molecular sieves. In a typical mechanochemical experiment, 0.5 mmol (20 mg) of MgO or  $\text{Mg}(\text{OH})_2$  (29 mg) was ground with the appropriate amount of the ligand, in the presence of water and/or organic solvent. For the construction of  $\text{Mg}(\text{H}_2\text{O})_6(\text{ibu})_2 \cdot 2\text{H}_2\text{O}$ , 206 mg (1 mmol) of ibuprofen were used, along with 70  $\mu\text{L}$  water (3.9 mmol). For the construction of  $\text{Mg}(\text{H}_2\text{O})_4(\text{sal})_2$ , 138 mg **Hsal** (1 mmol) was used along with 40  $\mu\text{L}$   $\text{H}_2\text{O}$  (2.2 mmol), while the synthesis of compound **1** involved additional 93  $\mu\text{L}$  **15c5**, 10  $\mu\text{L}$   $\text{H}_2\text{O}$  and 30  $\mu\text{L}$  acetonitrile. In each case the reaction mixture was placed in a stainless steel jar of 10 mL volume along with a pair of stainless steel balls of 7 mm diameter, and ground using a Retsch MM200 mill operating at a frequency of 30 Hz. The temperature of the reaction mixture measured immediately after grinding never exceeded 30 °C.

**Powder X-ray diffraction** PXRD data were collected on a Philips X'Pert Pro diffractometer, equipped with an X'celerator RTMS detector, using Ni-filtered  $\text{CuK}\alpha$  radiation, using a flat plate configuration.

**Single crystal X-ray diffraction** Single crystal diffraction data were collected on a Nonius Kappa CCD diffractometer equipped with a graphite monochromator and an Oxford cryostream, using  $\text{MoK}\alpha$  radiation. Structure solution and refinement was performed using SHELX available with the WinGX package of crystallographic tools, running on a Pentium-based PC under MS Windows XP.

**Thermogravimetric analysis** Thermogravimetric measurements were performed on a Mettler Toledo TGA/SDTA851<sup>e</sup> thermobalance, using samples of 10-15 mg weight placed in 100  $\mu\text{L}$  pierced lid aluminium pans. All measurements were performed in a dynamic atmosphere of air (100  $\text{cm}^3/\text{min}$ ), and at a heating rate of 20  $\text{K min}^{-1}$ .

**FT-IR reflectance spectroscopy** Spectra were recorded on a ThermoNicolet NEXUS spectrometer with the Golden Gate ATR accessory, in the range 4000-600  $\text{cm}^{-1}$ .

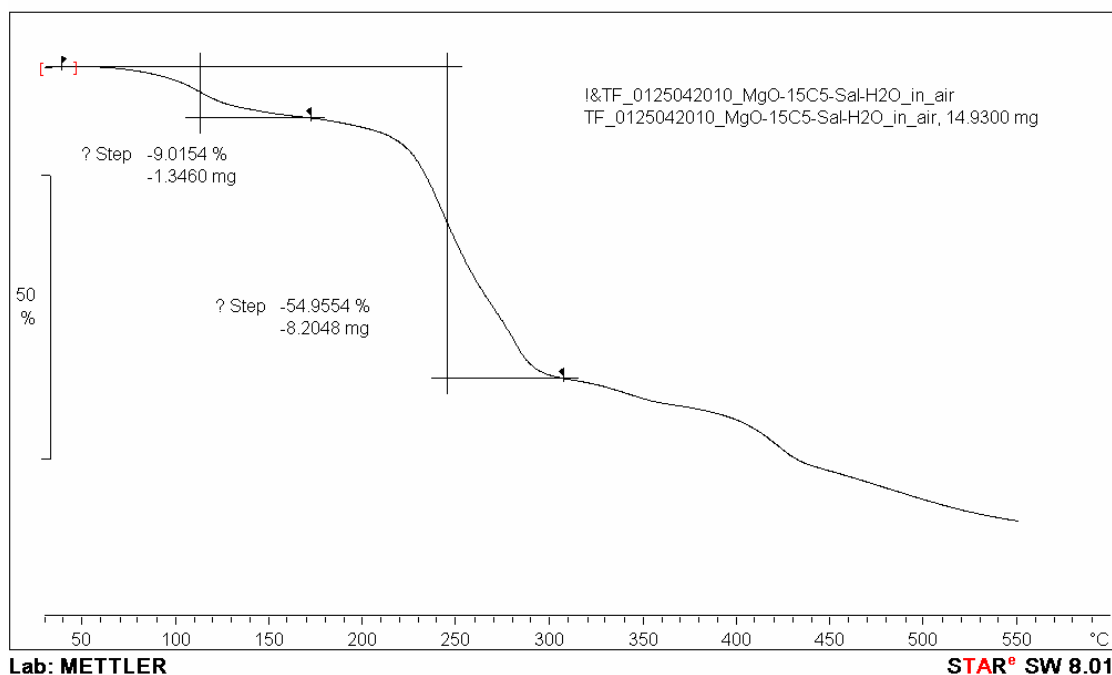

**Figure S1.** Reflectance FTIR spectra (from top to bottom):  $\text{Mg}(\text{H}_2\text{O})_6(\text{RS-ibu})_2 \cdot 2\text{H}_2\text{O}$ ; commercial **RS-Hibu**,  $\text{Mg}(\text{H}_2\text{O})_6(\text{S-ibu})_2 \cdot 2\text{H}_2\text{O}$ ; commercial **S-Hibu**.

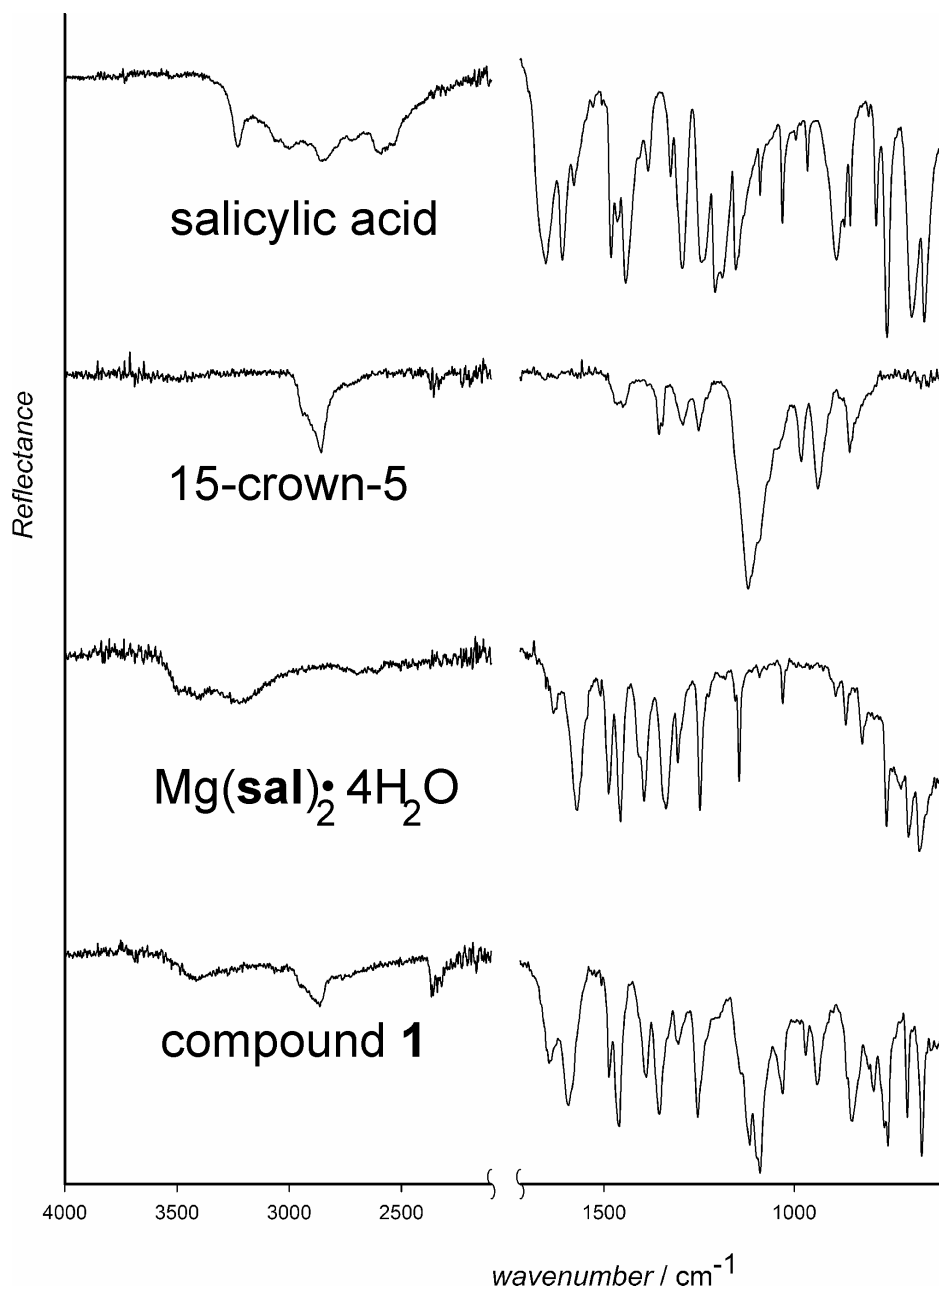

**Figure S2.** Powder diffraction patterns (from top to bottom): **RS-Hibu**; product of 30 min neat grinding of MgO and **RS-Hibu**; product of 30 min neat grinding of Mg(OH)<sub>2</sub> and **RS-Hibu**; product of 5 min LAG of MgO and **RS-Hibu**; product of 30 min LAG of MgO and **RS-Hibu**; commercial Mg(OH)<sub>2</sub> and the product of 30 min grinding of MgO and water in 1:1 stoichiometric ratio.

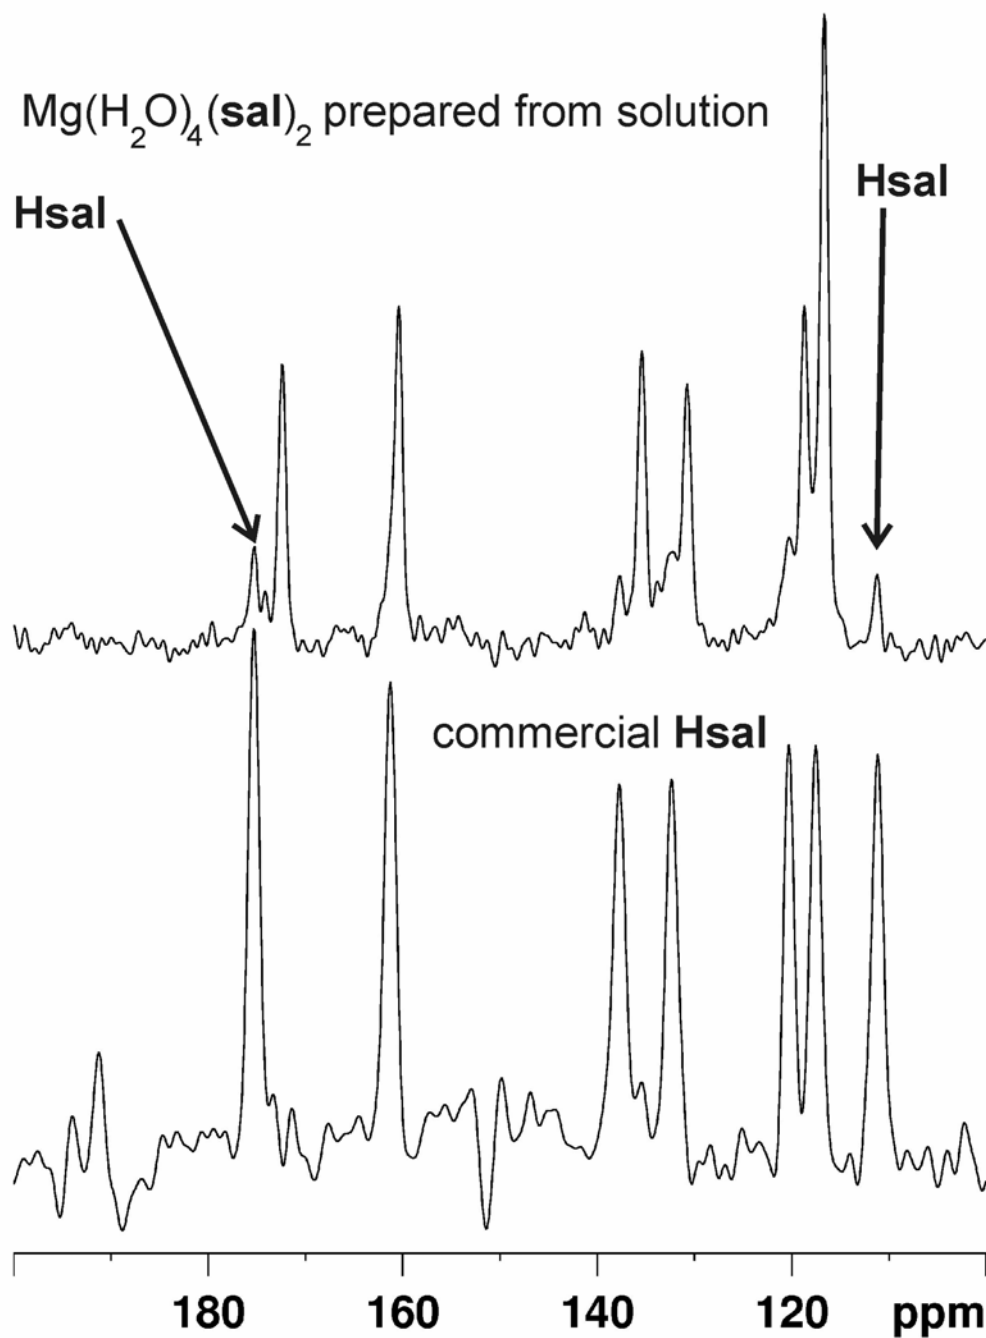

**Figure S3.** Thermogram of thermal decomposition of  $\text{Mg}(\text{H}_2\text{O})_6(\text{RS-ibu})_2 \cdot 2\text{H}_2\text{O}$ . Calculated percentage of water is 24.9%, observed loss is 23.9%.

**Figure S4.** Thermogram of thermal decomposition of compound **1**. The first step (9.0%) roughly corresponds to the loss of acetonitrile (7.9%) and is probably also accompanied by partial loss of water.

**Figure S5.** Reflectance FTIR spectra (from top to bottom): commercial salicylic acid, commercial **15c5**, synthesised Mg(sal)<sub>2</sub>(H<sub>2</sub>O)<sub>4</sub>; Compound **1**. Compound **1** clearly contains **15c5** and is different than the known magnesium salicylate tetrahydrate.

**Figure S6.** Cross-polarisation magic angle spinning (CP-MAS) solid-state  $^{13}\text{C}$  NMR spectra of solution-synthesised  $\text{Mg}(\text{H}_2\text{O})_4(\text{sal})_2$  (top) and commercial **Hsal** (bottom). The NMR spectra reveal that solution synthesis provides a sample of magnesium salicylate tetrahydrate containing a small amount of starting material salicylic acid.

**Figure S7.** Cross-polarisation magic angle spinning (CP-MAS) solid-state  $^{13}\text{C}$  NMR spectrum of Compound **1**. Besides demonstrating a difference from the  $\text{Mg}(\text{H}_2\text{O})_2(\text{sal})_2$  in the region 100-200 ppm, the spectrum also confirms the presence of **15c5** in the sample by the strong signal around 50 ppm. The absence of signals that could be assigned to acetonitrile suggests the included molecules are dynamic.
