### General experimental methods:

Flash column chromatography was performed using silica gel (60-Å pore size, 32–63 µm, standard grade). Analytical thin-layer chromatography was performed using glass plates pre-coated with 0.25 mm 230–400 mesh silica gel impregnated with a fluorescent indicator (254 nm). Thin layer chromatography plates were visualized by exposure to ultraviolet light. Organic solutions were concentrated on rotary evaporators at ~20 Torr (house vacuum) at 25–35 °C. Commercial reagents and solvents were used as received. Nuclear magnetic resonance (NMR) spectra are recorded in parts per million from internal tetramethylsilane on the δ scale.

### Representative experimental procedure:

The mixture of **1a** (61 mg, 0.2 mmol), PhI(OAc)<sub>2</sub> (193 mg, 0.6 mmol), and NaOAc (16 mg, 0.2 mmol) in dioxane (1 mL) was treated with Bu<sub>4</sub>NI (185 mg, 0.5 mmol). The reaction was allowed to stir at 25 °C for 1 h. Upon completion by TLC, the reaction mixture was quenched with saturated Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> (25 mL), and extracted by ethyl acetate (25 mL x 3). The organic layer was dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo. The residue was purified by column chromatography on silica gel (15% ethyl acetate in hexanes) to provide 2-methyl-3-oxo-1-tosylindolin-2-yl acetate **3a** in 89% yield.
