The synthesized compounds were identified by means of  $^1\text{H}$  NMR spectroscopy (JEOL AL300 and AL400), matrix-assisted laser desorption ionization time-of-flight (MALDI-TOF) mass spectrometry (PE Biosystems Voyager Elite), and elemental analysis. Optical rotations of the chiral cyclic compounds were measured using a JASCO DIP-370 polarimeter. Morphological changes were examined on Mettler hot-stages (models FP-90 and FP-82HT). Absorption spectra were measured using a JASCO V-530 spectrometer. Circular dichroism (CD) spectra were obtained using a JASCO J-720 spectrometer. The thermal behaviour of the compounds was examined on the same spectrometer equipped with a JASCO EHC-477. The thermal behaviour of the materials was also evaluated using differential scanning calorimetry (DSC; Perkin-Elmer DSC7, heating and cooling rate:  $10\ ^\circ\text{C min}^{-1}$ ) and X-ray diffractometry (MacScience MXP21TA-PO). Crystal data for structure analyses, cell determination, and face indices of the crystal were collected on a diffractometer (RIGAKU AFC-8) with a charge-coupled device (CCD) detector (Saturn 70CCD) by using  $\text{MoK}\alpha$  radiation. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via [www.ccdc.cam.ac.uk/data\\_request/cif](http://www.ccdc.cam.ac.uk/data_request/cif).

Samples were irradiated at 365 nm (light intensity:  $10\ \text{mW cm}^{-2}$ ) and 436 nm ( $10\ \text{mW cm}^{-2}$ ) using glass filters (Asahi Spectra HQBP365 and HQBP436, respectively) and a 120 W high-pressure mercury lamp (Asahi Spectra REX-120).

Thin films were fabricated by spin-coating a solution of the compound (1 wt%) in chloroform onto a fused silica substrate at a rate of 500 or 1000 rpm for 30 s. The films were annealed at  $100\ ^\circ\text{C}$  for 30 min and then cooled to form a glassy state. The sample thickness was checked using a Dektak surface profiler. The orientational behaviour of the films was determined using a polarizing microscope (Nikon E600WPOL) equipped with a digital camera (Nikon CoolPix995).

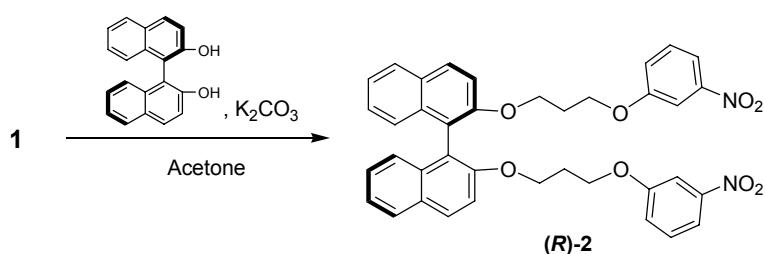

### Synthesis of R3A and S3A

Unless otherwise noted, compounds and solvents were purchased from commercial suppliers and used without further purification. 3-Nitrophenol, 1,3-dibromopropane, (*R*)-2,2'-dihydroxy-1,1'-binaphthyl, and (*S*)-2,2'-dihydroxy-1,1'-binaphthyl were obtained from Tokyo Kasei Kogyo Co. Ltd. Lithium aluminum hydride, anhydrous acetonitrile, and anhydrous tetrahydrofuran were purchased from Kanto Kagaku Co. Ltd. Potassium carbonate and acetone were purchased from Junsei Kagaku Co., Ltd.

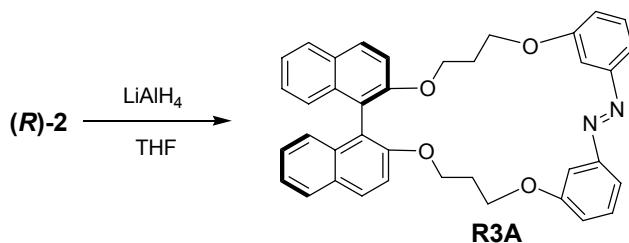

**3-Nitro-1-(3-bromopropoxy)benzene (1)**

To a solution of 3-nitrophenol (23.3 g, 167 mmol) and potassium carbonate (34.7 g, 251 mmol) in anhydrous acetonitrile (200 mL), 1,3-dibromopropane (270 g, 1.34 mol) was slowly added under nitrogen. The reaction mixture was heated under reflux for 24 h. The crude product was extracted with methylene chloride, and then washed with brine before drying over anhydrous magnesium sulfate. The solvent was evaporated under reduced pressure, and the solid residue was purified by column chromatography on silica gel (eluents: methylene chloride/hexane = 1:1) to yield **1** (31.4 g, 73 %).  $^1\text{H}$  NMR (300 MHz,  $\text{CDCl}_3$ ):  $\delta$  = 2.37 (quint, 2H,  $J$  = 6.3 Hz, Ar-OCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>Br), 3.62 (t, 2H,  $J$  = 6.3 Hz, Ar-OCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>Br), 4.20 (t, 2H,  $J$  = 6.3 Hz, Ar-OCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>Br), 7.25 (dd, 1H,  $J$  = 8.4, 2.4 Hz, aromatic rings), 7.44 (dd, 1H,  $J$  = 16.2, 8.1 Hz, aromatic rings), 7.75 (d, 1H,  $J$  = 2.4 Hz, aromatic rings), 7.85 ppm (d,  $J$  = 8.1 Hz, 1H, aromatic rings).

**(R)-2,2'-Bis[3-(3-nitrophenoxy)propoxy]-1,1'-binaphthyl ((R)-2)**

To a solution of (*R*)-2,2'-dihydroxy-1,1'-binaphthyl (5.52 g, 19.3 mmol) and potassium carbonate (7.99 g, 75.9 mmol) in acetone (500 mL), **1** (10.0 g, 38.6 mol) was slowly added. The reaction mixture was heated under reflux for 24 h. The crude product was extracted with methylene chloride, and then washed with brine before drying over anhydrous magnesium sulfate. The solvent was evaporated under reduced pressure, and the solid residue was purified by column chromatography on silica gel (eluent: methylene chloride) to yield **(R)-2** (9.70 g, 78 %).  $^1\text{H}$  NMR (400 MHz,  $\text{DMSO-d}_6$ ):  $\delta$  = 1.79 (t, 4H,  $J$  = 5.6 Hz, Ar-OCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>O-binaphthyl), 3.51 (m, 4H, Ar-OCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>O-binaphthyl), 4.10 (d, 4H,  $J$  = 5.6 Hz, Ar-OCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>O-binaphthyl), 6.91 (d, 2H,  $J$  = 8.8 Hz, aromatic rings), 6.99 (d, 2H,  $J$  = 8.4 Hz, aromatic rings), 7.11 (dd, 2H,  $J$  = 14.4, 7.6 Hz, aromatic rings), 7.22 (dd, 2H,  $J$  = 14.4, 7.2 Hz, aromatic rings), 7.31 (s, 2H, aromatic rings), 7.50 (dd, 2H,  $J$  = 16.4, 8.4 Hz, aromatic rings), 7.57 (d, 2H,  $J$  = 9.0 Hz, aromatic rings), 7.78 (d, 2H,  $J$  = 7.2 Hz, aromatic rings), 7.86 (d, 2H,  $J$  = 8.0 Hz, aromatic rings), 8.00 ppm (d, 2H,  $J$  = 9.0 Hz, aromatic rings).

***trans-(R)-2,2'-Bis[3-(3"-phenoxy)propoxy]-1"-azo-1,1'-binaphthyl (trans-R3A)***

To a solution of lithium aluminum hydride (3.6 g, 93 mmol) in anhydrous tetrahydrofuran (300 mL), **(R)-2** (6.0 g, 9.3 mol) was slowly added at 0 °C under nitrogen. The reaction mixture was stirred at room temperature for 24 h, and then heated under reflux for 24h. The crude product was extracted with methylene chloride, and then washed with brine before drying over anhydrous magnesium sulfate. The solvent was evaporated off under reduced pressure, and the solid residue was purified by column chromatography on silica gel (eluents: methylene chloride/hexane = 3:2). The fraction was collected and purified by preparative size exclusion chromatography (Shodex K5001, eluent: chloroform). The first fraction was collected and evaporated to dryness to afford **trans-R3A** (0.22 g, 4 %). <sup>1</sup>H NMR (300 MHz, DMSO-d<sub>6</sub>): δ = 1.48 (m, 2H, Ar-OCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>O-binaphthyl), 1.90 (m, 2H, Ar-OCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>O-binaphthyl), 3.57 (m, 4H, Ar-OCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>O-binaphthyl), 3.70 (t, 2H, J = 8.1 Hz, Ar-OCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>O-binaphthyl), 4.41 (t, 2H, J = 6.9 Hz, Ar-OCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>O-binaphthyl), 6.96 (d, 2H, J = 7.8 Hz, aromatic rings), 7.15 (m, 4H, aromatic rings), 7.39 (m, 10H, aromatic rings), 7.89 ppm (m, 4H, aromatic rings). Anal. Calcd. for C<sub>38</sub>H<sub>32</sub>N<sub>2</sub>O<sub>4</sub>: C, 78.60; H, 5.55; N, 4.82. Found: C, 78.43; H, 5.61; N, 4.83. MALDI-TOF MS: m/z = 580.1 [M<sup>+</sup>].

***trans-(S)-2,2'-Bis[3-(3"-phenoxy)propoxy]-1"-azo-1,1'-binaphthyl (trans-S3A)***

**trans-S3A** was prepared from *(S)*-2,2'-dihydroxy-1,1'-binaphthyl using a method similar to that described for **trans-R3A**. Yield: 4%. Anal. Calcd. for C<sub>38</sub>H<sub>32</sub>N<sub>2</sub>O<sub>4</sub>: C, 78.60; H, 5.55; N, 4.82. Found: C, 78.37; H, 5.55; N, 4.66. MALDI-TOF MS: m/z = 580.1 [M<sup>+</sup>].

***trans-(R)-2,2'-Bis{3-(2"-phenoxy)propoxy}-1"-azo-1,1'-binaphthyl (trans-R2A)*** and ***trans-(S)-2,2'-Bis{3-(2"-phenoxy)propoxy}-1"-azo-1,1'-binaphthyl (trans-S2A)*** were synthesized as previously reported.<sup>[1]</sup>

**Determination of the Thermodynamic Parameters of *cis* to *trans* thermal back-isomerization<sup>[2]</sup>**

The thermal *cis-trans* back-isomerization process was investigated. For the thermal *cis-trans* back-isomerization,

$$\ln \frac{[cis]}{[cis]_0} = -kt \quad (1)$$

where  $[cis]$  and  $[cis]_0$  are the concentrations of the *cis* azobenzene at time  $t$  and initially, respectively, and  $k$  is the rate constant for the thermal *cis-trans* isomerization. The first-order rate constant was determined by fitting the experimental data to the equation,

$$\ln \frac{A_\infty - A_t}{A_\infty - A_0} = -kt \quad (2)$$

where  $A_t$ ,  $A_0$  and  $A_\infty$  are the absorbance at 365 nm at time  $t$ , initially and at infinity, respectively. The first order plots according to eq. 2 for the *cis-trans* thermal isomerization of **R3A** in 1,4-dioxane and a neat film are shown in Figures S4 a) and S10 b), respectively.

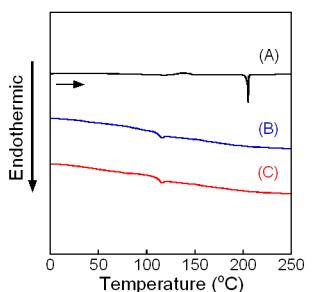

The thermodynamic parameters such as enthalpy of activation ( $\Delta H^\ddagger$ ) and entropy of activation ( $\Delta S^\ddagger$ ) were determined according to the Eyring equation:

$$k = \frac{k_B T}{h} \exp\left(\frac{\Delta S^\ddagger}{R}\right) \exp\left(-\frac{\Delta H^\ddagger}{RT}\right) \quad (3)$$

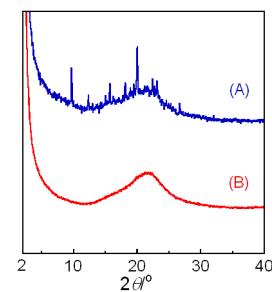

where  $R$ ,  $k_B$ , and  $h$  are the gas, Boltzmann, and Planck constant, respectively. Substituting into eq. 3,

$$\ln\left(\frac{kh}{k_B T}\right) = -\frac{\Delta H^\ddagger}{RT} + \frac{\Delta S^\ddagger}{R} \quad (4)$$

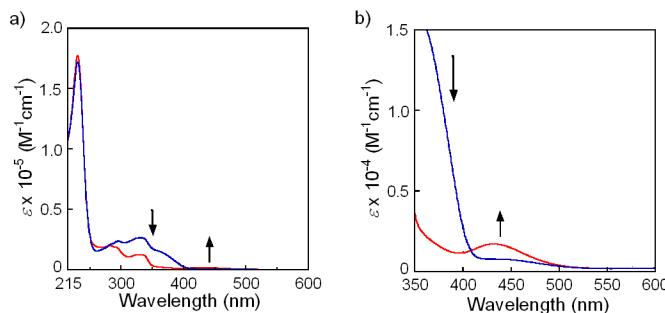

Figure S4 b) shows Eyring plots for *cis* to *trans* thermal isomerization of **R3A** in 1,4-dioxane. The values of  $\Delta S^\ddagger$  and  $\Delta H^\ddagger$  were obtained from the intersect and slope, respectively, of the linear plot of  $\ln(kh/k_B T)$  versus  $1/T$  extrapolated to  $T \rightarrow \infty$ .
