

SUPPORTING INFORMATION

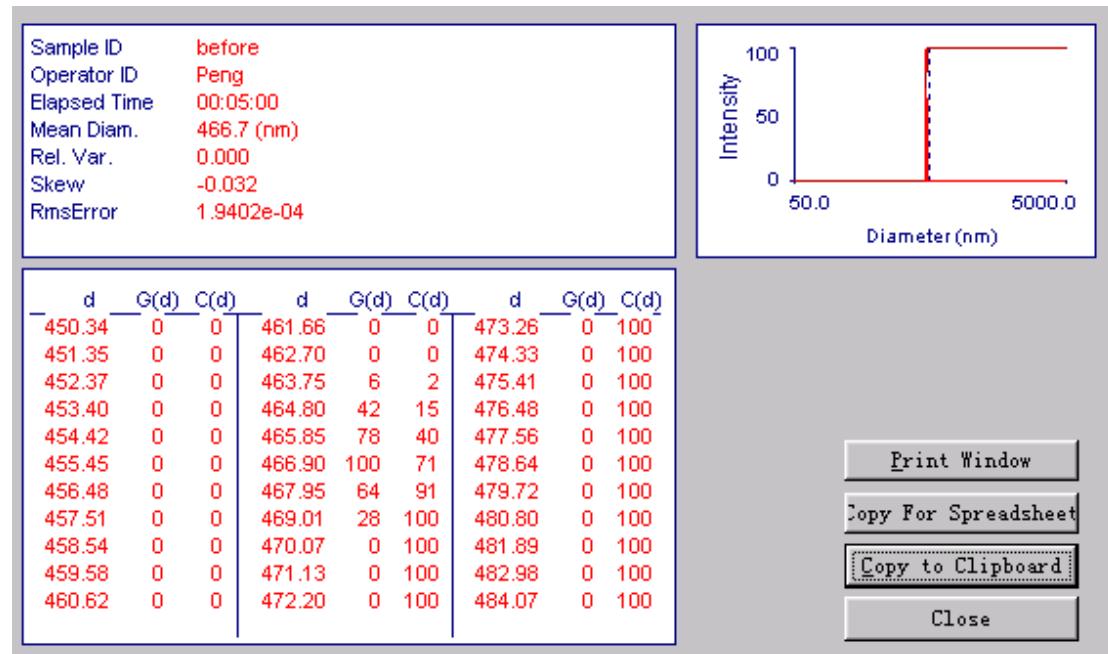

I. Experimental Section

The berberine release experiments

The light-induced release berberine was carried out by exposing the AuNPs-liposomes without dissociative berberine to light of 250 nm wavelength (80W) at a certain time and 25 °C. After irradiation, the release berberine was separated by dialysis the liposomes and the absorbance of berberine solution after dialysis was measured at 345 nm wavelength by UV-Vis spectrophotometer (Agilent UV-8453) and it was converted into concentration using a standard curve, and the relationships between berberine concentrations released from liposome and release time were obtained.

II. Size and size dispersion for AuNPs-liposome before drug release and after drug release (light scattering measurement)
