## **MATERIALS AND METHODS**

**Materials:** Tris-(2-aminoethyl)-amine (TREN), pentafluorobenzoyl chloride, 18-crown-6, hexafluorobenzene, tetrabutylammonium salts of fluoride and chloride, were purchased from Sigma-Aldrich and were used as received. Tetrahydrofuran (THF) was freshly distilled over potassium and benzophenone. Triethylamine, dichloromethane and chloroform were distilled over calcium hydride and acetonitrile was dried over phosphorous pentoxide prior to use by usual procedure. De-ionized water was used for crystallization and extraction. Potassium fluoride and Potassium chloride were purchased from Spectrochem, India. All solvents were procured from Merck. Buffer capsules for pH 4.0 and 9.0 are purchased from Merck Ltd.

**Methods:** Melting points of receptor **L**<sup>2</sup> and complexes were determined on a BioCote melting point apparatus. FTIR was recorded on SHIMADZU FTIR-8400S infrared spectrophotometer with KBr pellets. HRMS experiment was carried out on a Water's QtoF Model YA 263 mass spectrometer in positive ESI mode. <sup>1</sup>H-NMR and <sup>13</sup>C-NMR spectra were obtained on a 300 MHz and 75 MHz Bruker DPX-300 MHz NMR Spectrometer. <sup>19</sup>F-NMR and <sup>35</sup>Cl-NMR spectra were obtained on a 500 MHz Bruker DPX-500 MHz NMR spectrometer. Hexafluorobenzene was used as internal standard in <sup>19</sup>F-NMR studies. Powder X-ray diffraction (PXRD) analysis were performed using a Bruker axs (D8 Advance) diffractometer supported by LynxEye super-speed detector and Ni-filtered CuK $\alpha$  ( $\lambda = 0.154$  nm) radiation generated at 40 kV/40 mA. Energy Dispersive X-ray (EDX) analyses were carried out on a field emission scanning electron microscope (FE-SEM) using JEOL, JSM-6700F equipment operated with the accelerating voltage 5 kV.

**X-ray Crystallography:** Crystals suitable for single crystal X-ray diffraction studies were selected from the crystallization vial and immersed in paratone oil and then mounted on the tip of a glass fibre and cemented using epoxy resin. Intensity data for the crystals **1**, **2**, **3** and **4** were collected using MoK $\alpha$  ( $\lambda = 0.7107$  Å) radiation on a Bruker SMART APEX II diffractometer equipped with CCD area detector. The data integration and reduction were processed with SAINT<sup>2</sup> software provided with the software package of SAMRT APEX II. An empirical absorption correction was applied to the collected reflections with SADABS<sup>3</sup>. The structures were solved by direct methods using SHELXTL<sup>4</sup> and were refined on  $F^2$  by the full-matrix least-squares technique using the SHELXL-97<sup>5</sup> program package. Graphics were generated using PLATON<sup>6</sup> and MERCURY 1.4.<sup>7</sup> The non-hydrogen atoms were refined anisotropically till the convergence. In cases of complexes **1**, **3**, and **4**, the hydrogen atoms were geometrically fixed at idealized positions. In the case of complex **2**, all the hydrogen atoms were located from the difference Fourier map and refined isotropically. In cases of complex **1** and **3**, even though the data was collected at 100 K, the hydrogen atoms attached to the lattice water molecule could not be located from the difference Fourier map. In complex **2**, the methyl group (C39) of tetrabutylammonium cation is disordered at two position

and the occupancy factors of these two positions were treated with FVAR command of the SHELXTL program and refined isotropically. The hydrogen atoms to these disordered atoms (C38 and C39) are not either located or fixed. The whole crown-ether moiety of complex **3** is disordered at two sites and the occupancy factors were refined using the FVAR command of the SHELXTL program and isotropically refined. The hydrogen atoms to these disordered atoms are not either located or fixed. The lattice water molecule (O4w) is refined isotropically and the hydrogen atoms attached to this molecule cannot be either located or fixed from difference Fourier Map. CCDC-701763 (**1**), CCDC-710731 (**2**), CCDC-732760 (**3**) and CCDC-743775 (**4**) contain the supplementary crystallographic data for this paper. Though the data quality of complexes **2**, **3** and **4** are poor, these are the best set of data available for the complexes (**2**, **3** and **4**) after several attempts of data collection from the crystals obtained from several batches. Different solvent systems acetonitrile-water mixture, ethylacetate, dichloromethane, methanol and methanol-water mixture (for complex **2**) and chloroform, acetonitrile, ethylacetate, methanol-chloroform mixture, acetonitrile-chloroform mixture and di-isopropyl ether diffusion in acetonitrile (for complexes **3** and **4**) were tried to grow crystals suitable for single crystal X-ray diffraction studies. Upon several efforts we could able to grow crystals for **2** only in acetonitrile-water mixture whereas for complexes **3** and **4** in chloroform. Rest of the solvent systems either resulted in even poor quality crystals or solid masses. Our effort to grow better quality crystals following different crystallization techniques like slow evaporation at room temperature and at 4°C in refrigerator or diffusion method was not successful. Data collections following different strategies by increasing the number of frames and exposure time per frame also did not provide better data sets.

#### **Extraction Experiments:**

73 mg (0.1 mmol) of **L**<sup>2</sup> and 26.4 mg (0.1 mmol) of **L**<sup>1</sup> in 10 ml of chloroform and 58.1 mg (1.0 mmol) of KF or 74.5 mg (1.0 mmol) of KCl dissolved in 10 ml of distilled water were placed in a 50 ml round bottom flask. The two layers were extensively mixed by stirring the solution at room temperature for 6 hrs. The two layers were transferred to a separating funnel and the separating funnel was allowed to settle for 1 hr to ensure that the two phases reached equilibrium, and then the organic phases in the two samples were collected and passed through silicone treated Whatmann 1PS filter paper. The organic layer was evaporated to dryness under reduced vacuum. The colorless solid was washed with cold diethyl ether (20 ml x 3 times) to remove un-reacted **L**<sup>1</sup> and dried. This extracted mass was further subjected to various analyses. Competition experiments are performed under the same experimental conditions in the presence of KNO<sub>3</sub> (1.0 mmol).

#### **Control Experiments:**

73 mg (0.1 mmol) of **L**<sup>2</sup> or 26.4 mg (0.1 mmol) of **L**<sup>1</sup> in 10 ml of chloroform and 58.1 mg (1.0 mmol) of KF or 74.5 mg (1.0 mmol) of KCl dissolved in 10 ml of distilled water were placed in a 50 ml round bottom flask. The two layers were extensively mixed by stirring the solution at room temperature for 6

hrs. The two layers were transferred to a separating funnel and the separating funnel was allowed to settle for 1 hr to ensure that the two phases reached equilibrium, and then the organic phases in the two samples were collected and passed through silicone treated Whatmann 1PS filter paper. The organic layer was evaporated to dryness under reduced vacuum. The residue was washed with cold diethyl ether (20 ml x 3 times) to remove un-reacted  $L^1$  and dried. This residue was further subjected to various analyses.

Extraction Experiments at Different pH:

The experimental conditions are kept same as discussed earlier. The buffer systems potassium hydrogen phthalate and Boric acid/KCl/NaOH were employed to adjust the respective pH values ~4.0 and ~9.0.

## SYNTHESES

**Synthesis of Compound L<sup>2</sup>:** L<sup>2</sup> is synthesized according to a modified procedure,<sup>1</sup> tris(2-aminoethyl)amine, tren, (1 mL, 6.7 mmol) was taken in a 250 mL round bottomed flask, and dissolved in 75 mL of dry tetrahydrofuran (THF). About 3 mL (slight excess) of dry triethylamine was added to the homogeneous mixture. The mixture was allowed to stir at room temperature in nitrogen atmosphere for 15 min. 2.8 mL (20 mmol) of 2,3,4,5,6-pentafluorobenzoyl chloride was dissolved in another 50 mL of dry THF and taken in a 100 mL pressure equalizing funnel. This solution was added dropwise for a period of 1 hour at constant stirring in room temperature. After the addition, the reaction mixture was allowed to stir at room temperature in nitrogen atmosphere for another 14 h. The white precipitate (triethylammonium chloride) formed was filtered out, and washed three times with cold THF. The solvent was removed by evaporation under reduced pressure at 40 °C to yield light yellow oil. The yellow oil was redissolved in 50 mL of dichloromethane (DCM), which was washed once with saturated NaCl solution, and three times with 100 mL of distilled water. The organic phase was separated, and dried over anhydrous sodium sulfate. Then the solvent was evaporated in *vacuo* to yield the desired product as colorless solid. The colorless solid was redissolved in 10 mL of hot DCM, and allowed to evaporate at 4°C to yield the required product as colorless crystals (4.5 g, 92%). FTIR (cm<sup>-1</sup>): 3249.83 (br, -NH, *str*), 1654.81 (br, -CO, *str*), 1519.8, 1500.52 (s, -NH, *ben*). HRMS (ESI): 728.9133 [M+H<sup>+</sup>] and 750.8843 [M+Na<sup>+</sup>]. <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>): δ 2.72 (t, 6H, NCH<sub>2</sub>, J = 6 Hz), 3.49 (t, 6H, NCH<sub>2</sub>CH<sub>2</sub>, J = 6 Hz), 7.23 (t, 3H, NH). <sup>13</sup>C NMR (75.47 MHz, CDCl<sub>3</sub>): δ 38.41 (NCH<sub>2</sub>), 54.47 (NCH<sub>2</sub>CH<sub>2</sub>), 111.29 (m of s, Ar, CC-F, J<sub>CCF</sub> = 15Hz), 137.43 (m of d, Ar, C-F, J<sub>CF</sub> = 252 Hz), 142.25 (m of d, Ar, C-F J<sub>CF</sub> = 252 Hz), 144.79 (m of d, Ar, C-F, J<sub>CF</sub> = 249 Hz), 158.77 (s, C=O). <sup>19</sup>F NMR (500 MHz, CDCl<sub>3</sub>): δ -163.86 (t, 2Ar-F, J<sub>F-F</sub> = 20 Hz), -155.42 (t, Ar-F, J<sub>F-F</sub> = 20 Hz), -143.98 (d, 2 Ar-F, J<sub>F-F</sub> = 20 Hz). Melting Point: 175-176°C. Elemental analysis: Calculated:- C-44.52, H-2.08, N-7.69 %, Experimental:- C-44.97, H-1.82, N-7.56 %.

**Synthesis of Complex 1:** 60 mg (0.08 mmol) of L<sup>2</sup> was dissolved in 10 ml of H<sub>2</sub>O or CH<sub>3</sub>CN/H<sub>2</sub>O (1:1 v/v) and then 63 mg (0.24 mmol) of *n*-Bu<sub>4</sub>N<sup>+</sup>F<sup>-</sup> was added to the above solution. Then the mixture was stirred at room temperature for 10 minutes and heated to 60°C. Then, the mixture was filtered at room temperature and allowed to evaporate for crystallization. After a week, colourless crystalline solid of the complex was obtained in 75% yield. Upon re-crystallisation acetonitrile/water few colourless crystal of complex [L<sup>2</sup>(F)·H<sub>2</sub>O]·*n*-Bu<sub>4</sub>N<sup>+</sup> (**1**) suitable for X-ray diffraction studies were obtained upon slow and complete evaporation of the solvent. Melting Point: 120-122°C. <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>): δ 1.00 (t, 3H, NCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>, J = 7.2 Hz), 1.42 (m, 2H, NCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 1.93 (m, 2H, NCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 2.56 (t, 6H, NCH<sub>2</sub>CH<sub>2</sub>, J = 4.8 Hz), 3.17 (m, 2H, NCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>3</sub>), 3.43 (t, 6H, NCH<sub>2</sub>CH<sub>2</sub>, J = 4.8 Hz), 11.73 (br, 3H, NH). <sup>19</sup>F NMR (500 MHz, CDCl<sub>3</sub>): δ -165.26 (br, 2Ar-F), -158.48 (br, Ar-F), -145.38 (br,

2 Ar-F), -110.22 (br, 1-F). Elemental analysis: calculated: C – 51.24%, H – 5.30%, N – 6.95% and experimental: C – 51.94%, H – 5.93%, N – 6.70%.

**Synthesis of Complex 2:** 60 mg (0.08 mmol) of  $L^2$  was dissolved in 10 ml of  $CH_3CN/H_2O$  (1:1 v/v) mixture and then 67 mg (0.24 mmol) of  $n-Bu_4N^+Cl^-$  was added to the above solution. The reaction mixture was further stirred at room temperature for 10 minutes. Then, mixture was filtered at room temperature and the filtrate was allowed for crystallization. After a week, colourless crystalline solid of the complex was obtained in ~60% yield. Upon re-crystallisation acetonitrile/water few colourless crystal of complex  $[L^2(Cl^-)] \cdot n-Bu_4N^+$  (**2**) suitable for X-ray diffraction studies were obtained upon slow and complete evaporation of the solvent. Melting Point: 114-116°C.  $^1H$  NMR (300 MHz,  $CDCl_3$ ):  $\delta$  0.99 (t, 3H,  $NCH_2CH_2CH_2CH_3$ ,  $J = 7.2$  Hz), 1.38-1.43 (m, 2H,  $NCH_2CH_2CH_2CH_3$ ), 1.90 (m, 2H,  $NCH_2CH_2CH_2CH_3$ ), 2.56 (t, 6H,  $NCH_2CH_2$ ,  $J = 4.8$  Hz), 3.26 (m, 2H,  $NCH_2CH_2CH_2CH_3$ ), 3.47 (t, 6H,  $NCH_2CH_2$ ,  $J = 4.8$  Hz), 9.76 (br, 3H, NH). Elemental analysis: calculated: C – 43.41%, H – 4.29%, N – 5.62% and experimental: C – 43.23%, H – 4.66%, N – 5.77%.

**Synthesis of Complex 3:** 73 mg (0.1 mmol) of  $L^2$  and 26.4 mg (0.1 mmol) of  $L^1$  were dissolved in 10 ml of chloroform. 58.1 mg (1.0 mmol) of KF was dissolved in 10 ml of distilled water and added to the above solution. The reaction mixture was further stirred at room temperature for 6 hrs. Then, organic layer was separated and allowed for crystallization at 4°C. The complex **3** was obtained by the removal of the solvent from the extracted mass under reduced pressure and followed by cold diethyl ether wash (5ml x 2) and room temperature drying. Yield = 48% (considering complex composition ( $L^1:L^2:KF = 1:1:1$ ) therefore 100% extraction should results (26.4 + 73 + 5.8 mg = 105.4 mg of **3**). Upon re-crystallization of the complex in chloroform, few colorless single crystals of complex  $[L^2L^1(F)(K^+)(H_2O)]$  (**3**) suitable for X-ray diffraction studies were obtained.  $^1H$  NMR (500 MHz,  $CDCl_3$ ):  $\delta$  2.66 (m, 6H,  $NCH_2CH_2$ ), 3.49 (m, 6H,  $NCH_2CH_2$ ), 3.63 (s, 24H, Crown- $NH_2$ ) 11.42 (br, 3H, NH).  $^{19}F$  NMR (500 MHz,  $CDCl_3$ ):  $\delta$  -165.25 (br, 2Ar-F), -158.47 (br, Ar-F), -145.37 (br, 2 Ar-F), -110.22 (br, 1-F).

**Synthesis of Complex 4:** 73 mg (0.1 mmol) of  $L^2$  and 26.4 mg (0.1 mmol) of  $L^1$  were dissolved in 10 ml of chloroform. 74.5 mg (1.0 mmol) of KCl was dissolved in 10 ml of distilled water and added to the above solution. The reaction mixture was further stirred at room temperature for 6 hrs. Then, organic layer was separated and allowed for crystallization at 4°C. The complex **4** was obtained by the removal of the solvent from the extracted mass under reduced pressure and followed by cold diethyl ether wash (5ml x 2) and room temperature drying. Yield = 44% (considering complex composition ( $L^1:L^2:KCl = 1:1:1$ ) therefore 100% extraction should results (26.4 + 73 + 7.4 mg = 106.8 mg of **4**). Upon re-crystallization of the complex in chloroform, few colorless single crystals of complex  $[L^2L^1(Cl)(K^+)(H_2O)]$  (**4**) suitable for X-ray diffraction studies were obtained.  $^1H$  NMR (500 MHz,  $CDCl_3$ ):  $\delta$  2.61 (m, 6H,  $NCH_2CH_2$ ), 3.49 (m, 6H,  $NCH_2CH_2$ ), 3.62 (s, 24H, Crown- $NH_2$ ) 9.49 (br, 3H, NH).  $^{35}Cl$  NMR (500 MHz,  $CDCl_3$ ):  $\delta$  14.76 (br, Cl).

**Table 9S.** Summary of KF and KCl Extraction Efficiencies.

	% of KF Extracted	% of KCl Extracted
$L^1$	NIL	NIL
$L^2$	NIL	NIL
$L^1 + L^2$	48	44

**Table 10S.** Summary of KF and KCl Extraction Efficiencies at different pH.

salts	% Extracted at pH 4.5	% Extracted at pH 6.3	% Extracted at pH 9.3
KF	45%	48%	NIL
KCl	43%	44%	NIL

## **CSD Search Results:**

A CSD (Version 5.29 November 2007) search was performed with Conquest, version 1.9 for H<sub>2</sub>O...pentafluorophenyl interaction. Search was performed by searching only X-C<sub>6</sub>F<sub>5</sub> and water (as figure shown below) keeping intermolecular distance (D) between water oxygen and centroid of pentafluorophenyl moiety less than 4.0 Å and filtered using R factor < 10%, no errors and not disordered. Search results only 4 hits which show contact between H<sub>2</sub>O and pentafluorophenyl moiety with the distances of 3.94 Å (DOLDEN), 3.783 Å (FEPJOA), 3.647 Å (GIWXAL) and 3.634 Å (IKIHIT).
