Figure S1

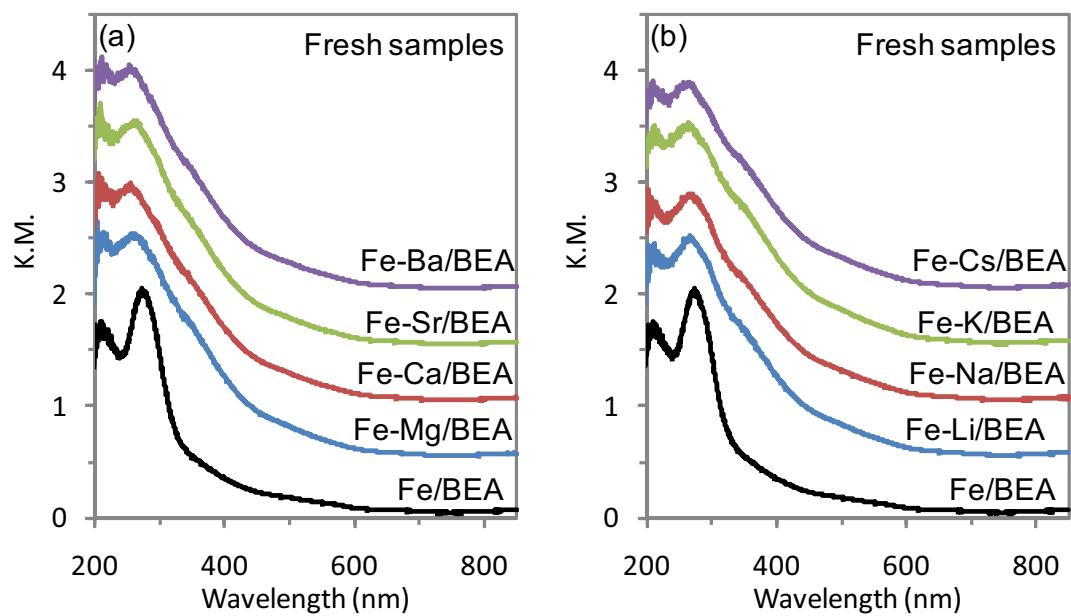

Fig. S1 UV-Vis spectra of alkali (a) and alkali earth (b) doped Fe/BEA.

Figure S2

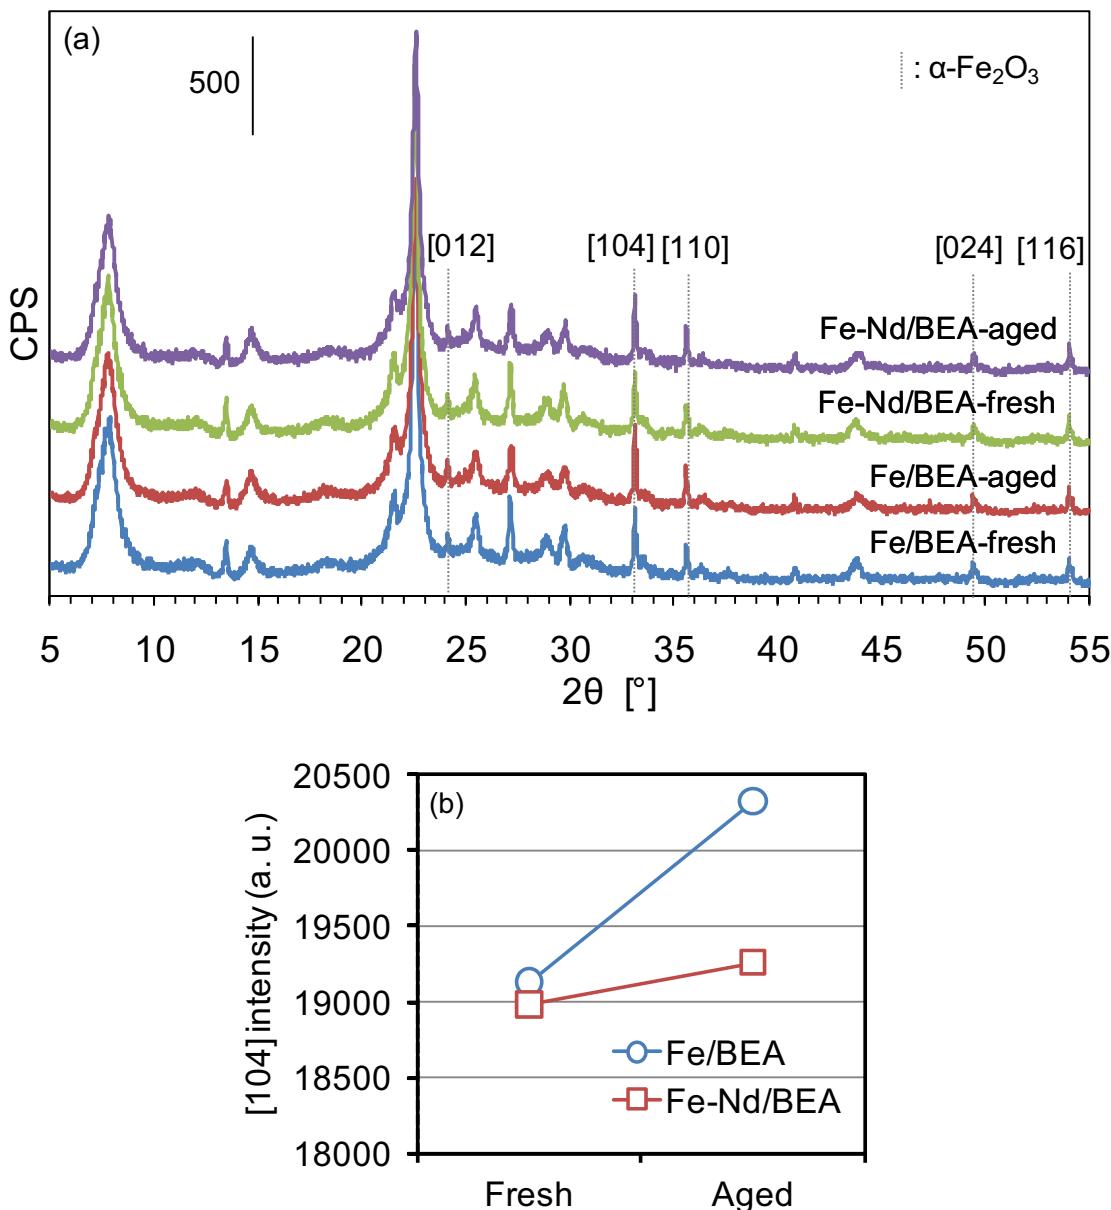

Fig. S2 XRD spectra of Fe/BEA and Fe-Nd/BEA for fresh and aged samples (a) and comparison of [104] intensity of $\alpha\text{-Fe}_2\text{O}_3$ phase (b). XRD was performed under Cu-K α radiation using a Rigaku Rint-TTR X-ray diffractometer. For wide-range measurements to record the spectra in Fig. S2a, a scanning speed was 3 °/min and a measurement interval was 0.02 °. For narrow-range measurements to estimate the [104] peak intensity in Fig. S2b, a scanning speed was 0.5 °/min and a measurement interval was 0.01 °.
