## Synthesis

$\left(\mathrm{PPh}_{4}\right)_{3}\left[\mathrm{Ru}(\mathrm{CN})_{6}\right]^{1}(200 \mathrm{mg}, 0.16 \mathrm{mmol})$ was stirred with $\mathrm{NEt}_{4} \mathrm{ClO}_{4}(120 \mathrm{mg}, 0.47 \mathrm{mmol})$ in $\mathrm{MeOH}(15 \mathrm{ml})$ for 10 min . The filtered solution was cooled to $-18{ }^{\circ} \mathrm{C}$ and filtered again. The pale, yellow solution was added to a cold, filtered solution of $[\mathrm{Mn}(5-\mathrm{Brsalen})(\mathrm{MeOH})] \mathrm{ClO}_{4}(100 \mathrm{mg}, 0.16 \mathrm{mmol})$ in $\mathrm{MeOH}(10 \mathrm{ml})$. The solution was left in the freezer $\left(-18{ }^{\circ} \mathrm{C}\right)$ overnight to give dark-brown, block-shaped crystals of $\mathbf{1}$ ( 50 $\mathrm{mg}, 44 \%$ based on Mn ). Anal. calcd (found) for $\mathrm{H}_{52} \mathrm{C}_{48} \mathrm{~N}_{11} \mathrm{O}_{6} \mathrm{Mn}_{2} \mathrm{Br}_{4} \mathrm{Ru}$ : C, $40.90 \%$ ( $40.93 \%$ ); H, $3.72 \%$ (3.54\%); N, 10.93\% (10.65\%).
${ }^{1}$ Prepared analogously to the $\mathrm{AsPh}_{4}{ }^{+}$salt, see J. Bendix, P. Steenberg and I. Søtofte, Inorg. Chem., 2003, 42, 4510-4512.

## X-ray crystallography

Single-crystal X-ray diffraction data were collected at $122(1) \mathrm{K}$ on a Nonius KappaCCD area-detector diffractometer, equipped with an Oxford Cryostreams low-temperature device, using graphitemonochromated Mo $K \alpha$ radiation $(\lambda=0.71073 \AA)$. The structure was solved using direct methods (SHELXS97) and refined using the SHELXL97 software package. ${ }^{[1]}$ All non-hydrogen atoms were refined anisotropically, hydrogen atoms were located in the difference Fourier map and refined isotropically as constraint riding their parent atom in a fixed geometry. Except for the hydrogen atom ( H 1 ) on the MeOH oxygen atom (O1) which hydrogen bonds to cyanide, this hydrogen atom was refined as a free independent atom. Crystal structure and refinement data for 1 are summarized in Table S1. The molecular structure diagrams were made with the Ortep-3 program. ${ }^{[2]}$
CCDC-806470 contain the supplementary crystallographic data for this paper.

## FDFT THz-EPR measurements

Linearly polarized THz radiation in the range between 5 and $30 \mathrm{~cm}^{-1}$ was coupled out from the BESSY storage ring. It was then passed through a FTIR spectrometer with the resolution set to $0.1 \mathrm{~cm}^{-1}$ and using a $125 \mu$ m-thick beamsplitter. The transmitted intensity was detected by a liquid-Helium cooled bolometer. The powder of $\mathbf{1}(70 \mathrm{mg})$ was carefully ground and filled into a sample holder with Teflon windows. The sample holder was mounted on a variable-temperature insert inside an opto-magnetic cryostat. The diameter of the cross-section exposed to the beam was $\sim 10 \mathrm{~mm}$. All measurements reported here were performed on the powder sample.
FDFT THz-EPR transmission spectra were calculated using full diagonalization of the Hamiltonian Eq. 1 with the parameters given in the main text. The calculated absorbance spectra shown in Fig. 3 of the main text take into account the reference at 25 K , which can lead to a negative "absorbance" at low temperatures for "warm" peaks, i.e. peaks that arise from transitions between excited states.

Fig. S3. Coarse $B$ field dependence at 5 K with fields indicated in the plot. The black solid lines are guides to the eye. The curves were offset by 1 unit per 1 T .

Fig. S4. Fine $B$ field dependence at 5 K in the vicinity of the crossing of M 1 and P 2 . The black solid lines are guides to the eye. The curves were offset by 1 unit per 200 mT .

## Magnetic measurements

The magnetic measurements were conducted on a Quantum-Design ${ }^{\text {TM }}$ MPMS-XL SQUID magnetometer located at the University of Copenhagen. The susceptibilities ( $H_{\mathrm{dc}}=1 \mathrm{kOe}$ ) were corrected for diamagnetic contributions from the sample holder and the sample (estimated from Pascal's constants). The polycrystalline sample was immobilized in frozen $n$-eicosane to prevent orientation effects. Ac susceptibility measurements were measured with various frequencies in the range $50-1500 \mathrm{~Hz}$ with an ac field amplitude of 3.8 Oe with and without an applied static field.

Fig. S5. Reduced magnetisation. Circles correspond to experimental data and lines represent simulations using the best-fit parameters mentioned in the text.

Fig. S6. In-phase (left) and out-of-phase (right) components of the ac susceptibility in the absence of a dc field. Solid lines are guides for the eyes.

Fig. S7. In-phase component of the ac susceptibility in the absence of a static field. Solid lines are guides for the eyes.

Fig. S8. In-phase (left) and out-of-phase (right) components of the ac susceptibility in an applied dc field of 4 kOe . Solid lines are guides for the eyes.
