## 1. General

The glass substrates covered with indium tin oxide (ITO) (5 $\Omega \mathrm{sq}^{-1}$ ) were purchased from GEOMATEC Co., Ltd. Poly(3,4-ethylenedioxythiophene):poly(styrenesulfonic acid) (PEDOT:PSS) (Denatron PT-100) was purchased from Nagase ChemteX Co. (6,6)-Phenyl $\mathrm{C}_{61}$-butyric acid methyl ester (PCBM) was purchased from Nano-C, Inc. Poly(3-hexylthiophene) (P3HT) was purchased from Sigma-Aldrich Co. Titanium tetraisopropoxide was purchased from Wako Pure Chemical Industries, Ltd. The ITO/glass substrate was cleaned with a UV/ozone cleaner (UV-253) (Filgen, Inc.). Photocurrent-voltage characteristics were measured by using a CEP 2000 (BUNKOUKEIKI Co., Ltd.). The light intensity of the illumination source was adjusted by using a standard silicon photodiode (BS520) (BUNKOUKEIKI Co., Ltd.). The thicknesses of the films were determined with an AlphaStep IQ Surface Profiler (KLA-Tencor Co.). The skeletally-modified fullerenes (SMFs) were prepared by following the procedure reported previously. ${ }^{1}$

## 2. CV of $1, \mathrm{C}_{60}$ and PCBM

The results on cyclic voltammerty (CV) for 2 and $\mathbf{3}$ were reported earlier. ${ }^{1}$

Fig. S1 CV (in 1,2- $-\mathrm{Cl}_{2} \mathrm{C}_{6} \mathrm{H}_{4}$ with $0.1 \mathrm{M} \mathrm{Bu}_{4} \mathrm{NBF}_{4}$, scan rate $20 \mathrm{mV} \mathrm{s}{ }^{-1}$ ) of $\mathbf{1}, \mathrm{C}_{60}$, and PCBM.

## 3. Procedure for fabrication of the BHJ solar cells

The photovoltaic devices with a layered structure of glass/ITO/PEDOT:PSS/1:P3HT/TiO ${ }_{x} / \mathrm{Al}$ were fabricated as follows. The ITO-coated glass substrate ( $5 \Omega \mathrm{sq}^{-1}, 2.5 \mathrm{~cm} \times 2.5 \mathrm{~cm}$ ) was washed carefully under ultrasonic irradiation using water, acetone, and ethanol. The substrate was further cleaned with a UV/ozone cleaner. A thin layer ( $\sim 40 \mathrm{~nm}$ ) of PEDOT:PSS was prepared onto the ITO surface by spincoating the solution (Denatron PT-100) at 5000 rpm for 1 min . The resulting substrate was heated at $200^{\circ} \mathrm{C}$ for 10 min under ambient conditions. Then, an active layer ( 77 nm ) was prepared onto the PEDOT:PSS layer by spin-coating a solution ( $50 \mu \mathrm{~L}$ ) containing SMF derivative 1 and P3HT (weight ratio of $1: 1.6$ ) in dry chlorobenzene with a concentration of $24 \mathrm{mg} / \mathrm{mL}$ at 1000 rpm for 40 seconds under argon. The substrate was annealed at $150{ }^{\circ} \mathrm{C}$ for 6 min under argon. After cooling to room temperature, a thin layer ( $\sim 10 \mathrm{~nm}$ ) of $\mathrm{TiO}_{x}$ was immediately prepared on the active layer by spin-coating a solution of titanium tetraisopropoxide in ethanol $(50 \mu \mathrm{~L})$ at 4000 rpm for $\sim 20$ seconds and by being hydrolyzed for 20 min under ambient conditions. Finally, aluminum electrodes were thermally deposited under vacuum ( $3.8 \times 10^{-5}$ Torr).

The devices based on SMF derivatives 2, 3, and PCBM were prepared in a manner similar to that described above. The thicknesses of the active layers of 2:P3HT and 3:P3HT were 84 nm and 95 nm , respectively.

## 4. IPCE of 3:P3HT-based device

(IPCE: Incident Photon to Current Conversion Efficiency)

Fig. S2 IPCE spectrum of the BHJ solar cell composed of $\mathbf{3}$ and P3HT.

## 5. UV-vis absorption spectra

The spectra of 1-3 and PCBM in cyclohexane (red line) and as the film on a quartz glass (blue line).
The films were prepared by spin-coating ( $1000 \mathrm{rpm}, 40$ seconds) the chlorobenzene solution of each $\mathrm{C}_{60}$ derivatives ( $9 \mathrm{mg} / \mathrm{mL}$ ) on a quartz glass.

## 6. UV-vis absorption spectra of the blend films

Normalized absorption spectra of the blend films consisting of the fullerene derivative (1-3 or PCBM) and P3HT. These films were prepared by spin-coating (1000 rpm, 40 s ) the chlorobenzene solution containing each fullerene derivative and P3HT at weight ratio of $1: 1.6$ with a concentration of 24 $\mathrm{mg} / \mathrm{mL}$. The spectra were recorded (a) before and (b) after annealing at $150{ }^{\circ} \mathrm{C}$ for 6 min under ambient conditions.

## 7. Optimized geometry of 1

Electron energies ( $E$ in hartrees) and Cartesian coordinates for compounds $\mathbf{1}$ (the two n-octyl groups were replaced by methyl groups) calculated at the B3LYP/6-31G* level. Optimized geometries of 2 and 3 were reported previously. ${ }^{1}$

## 8. LUMO Coefficients

(The DFT calculations were performed at the B3LYP/STO-3G//B3LYP/6-31G(d) level.)
The molecular orbital coefficients of the selected atoms were obtained by an equation:

$$
C=\left(C_{2 p x}{ }^{2}+C_{2 p x}{ }^{2}+C_{2 p x^{2}}\right)^{0.5}
$$

## large coefficients
