

Supporting information: Calix[4]arene-supported $\text{Fe}^{\text{III}}_2\text{Ln}^{\text{III}}_2$ clusters

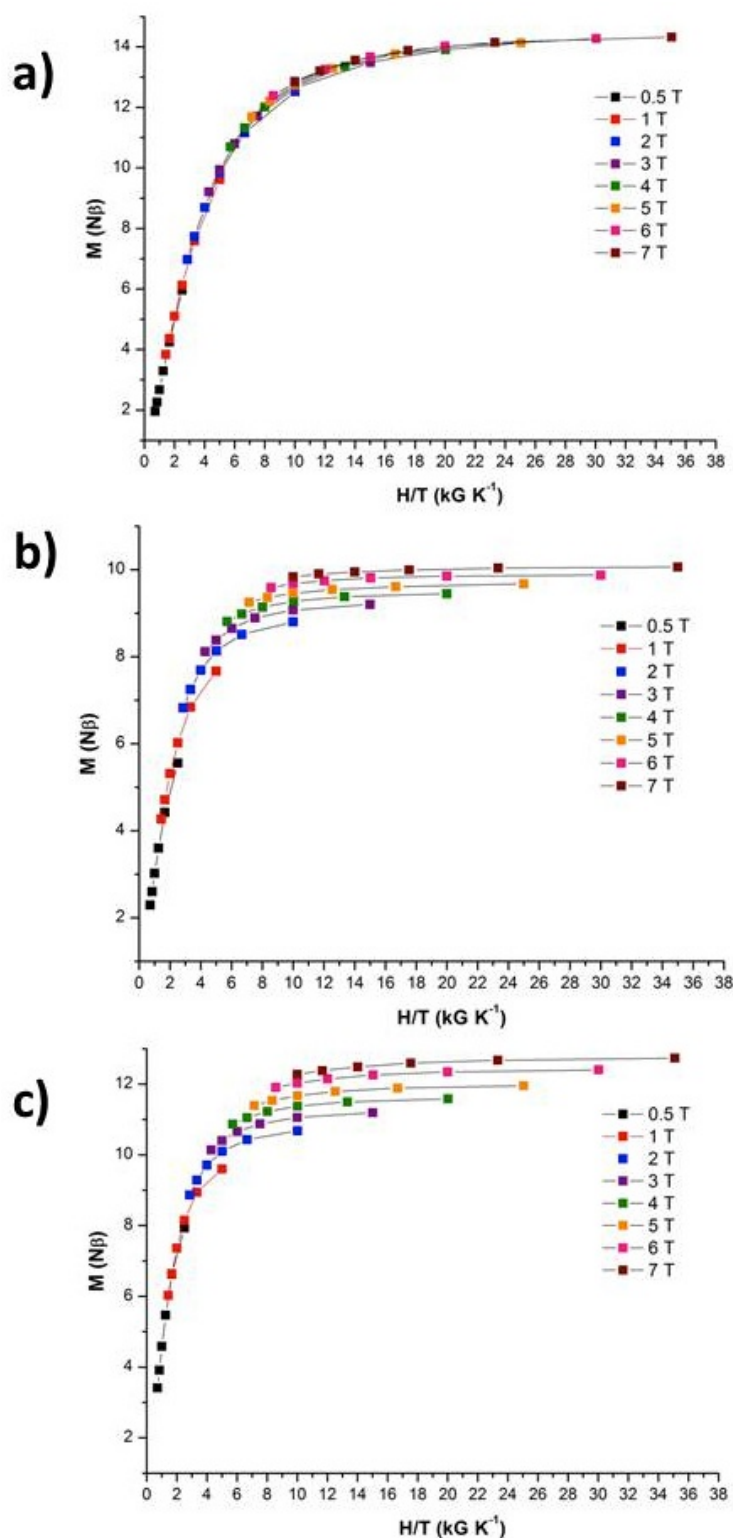

Figure S1. Reduced magnetisation versus field data for complexes 1-3 in the $T = 2-7 \text{ K}$ and $H = 1-7 \text{ T}$ temperature and field ranges. For 1 the isofield lines are super-imposable while those for 2 and 3 are not, reflecting the isotropic and anisotropic nature of the $\text{Ln}(\text{III})$ ions, respectively.
