## Experimental section

## Materials and Measurements

p-tert-Butylthiacalix[4]arene was prepared according to literature methods, ${ }^{\text {S1 }}$ while other chemicals were of reagent-grade quality obtained from commercial sources and used without further purification. Elemental analyses were performed with a German Elementary Varil EL III instrument. IR spectrum were recorded in the range $4000-400 \mathrm{~cm}^{-1}$ with a Magna 750 FT-IR spectrometer using KBr pellets. The powder X-ray diffraction (PXRD) were recorded by a RIGAKU-DMAX2500 X-ray diffractometer using $\mathrm{Cu} \mathrm{K} \alpha$ radiation $(\lambda=0.154 \mathrm{~nm})$ at a scanning rate of $3 \%$ min for $2 \theta$ ranging from $2^{\circ}$ to $50^{\circ}$. Magnetic susceptibilities were measured on polycrystalline samples with the Quantum Design PPMS9T and MPMS-XL systems. All experimental magnetic data were corrected for the diamagnetism of the sample holders and of the constituent atoms according to the Pascal's constants.

## Syntheses of complexes 1-2

Complex 1: A mixture of $\mathrm{H}_{4} \mathrm{BTC} 4 \mathrm{~A}(0.1 \mathrm{mmol}, 72 \mathrm{mg}), \mathrm{NiCl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}(0.4 \mathrm{mmol}, 95 \mathrm{mg})$ $\mathrm{Dy}(\mathrm{OAc})_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}(0.3 \mathrm{mmol}, 132 \mathrm{mg})$ and $\mathrm{Na}_{2} \mathrm{CO}_{3}(0.2 \mathrm{mmol}, 21 \mathrm{mg})$ in $\mathrm{DMA} / \mathrm{CH}_{3} \mathrm{CN} / \mathrm{Et}_{3} \mathrm{~N}(6 / 3 / 0.5$ mL ) was sealed in a 25 mL Teflon-lined bomb at 130 for 6 days, then cooled slowly at $4{ }^{\circ} \mathrm{Ch}^{-1}$ to room temperature. Slow concentration of the filtrate at room temperature for several days and then green blocky crystals of complex $\mathbf{1}(55 \mathrm{mg})$ were obtained in $33 \%$ yield based on $\mathrm{H}_{4} \mathrm{BTC} 4$ A. Anal. Calcd. for complex 1: calcd. C, 44.32; H, 5.45; N, 4.31. found C, 44.48; H, 5.19; N, 4.14. IR (KBr disk, $\left.v \mathrm{~cm}^{-1}\right): 3439(\mathrm{~m}), 3256(\mathrm{~m}), 2960(\mathrm{~S}), 2901(\mathrm{~m}), 2872(\mathrm{~m}), 1649(\mathrm{~S}), 1586(\mathrm{~S}), 1460(\mathrm{~s}), 1361(\mathrm{~m})$, 1319 (m), 1305 (m), 1258 (s), 1188 (m), 1130 (w), 1089 (w), 1016 (m), 911 (w), 883 (w), 865 (w), 834 (m), 750 (m), 733 (w), 672 (w), 590 (w), 542 (w).

Complex 2: Equivalent synthesis procedures were carried out employing $\mathrm{Tb}(\mathrm{OAc})_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}(0.3 \mathrm{mmol}$, $131 \mathrm{mg})$ to obtain the corresponding products. Colorless block crystals of complex $2(47 \mathrm{mg})$ were obtained in $28 \%$ yield based on $\mathrm{H}_{4}$ BTC4A. Anal. Calcd. for complex 2: calcd. C, 44.38 ; $\mathrm{H}, 5.46$; N, 4.31. found C, 44.26; H, 5.30; N, 4.26. IR (KBr disk, $v \mathrm{~cm}^{-1}$ ): 3439 (m), 3256 (m), 2960 (S), 2901 (m),

2872 (m), 1649 (S), 1586 (S), 1460 (s), 1361 (m), 1319 (m), 1305 (m), 1258 (s), 1188 (m), 1130 (w), 1089 (w), 1016 (m), 911 (w), 883 (w), 865 (w), 834 (m), 750 (m), 733 (w), 672 (w), 590 (w), 542 (w).

## X-ray Data Collection and Structure Determination

Data collection for complexes $\mathbf{1}$ and $\mathbf{2}$ were performed on Rigaku-CCD diffractometers equipped with graphite monochromated Mo-K $\alpha$ radiation $(\lambda=0.71073 \AA$ ) by using the $\omega$-scan mode at 123 K . All absorption corrections were applied using the CrystalClear program. The structures were solved by direct methods, the metal atoms were located from the E-maps, and other non-hydrogen atoms were derived from the successive difference Fourier peaks. The structures were refined on $F^{2}$ by full-matrix least-squares using the SHELXTL-97 program package. ${ }^{\text {S2 }}$ All non-hydrogen atoms were refined anisotropically except some solvent molecules and some disordered atoms, and hydrogen atoms of the organic ligands were generated theoretically onto the specific atoms and refined isotropically with fixed thermal factors. Some hydrogen atoms on solvent molecules cannot be generated and were included in the molecular formula directly. It was not possible to model all the disordered solvent molecules appropriately. The diffraction data were treated by the "SQUEEZE" method as implemented in PLATON to remove diffuse electron density associated with these badly disordered solvent molecules. ${ }^{53}$ This has the effect of dramatically improving the agreement indices. Solvent molecules in complexes 1 and 2 were estimated from the result of PLATON-SQUEEZE and the data of elemental analyses, and were included in the molecular formula directly. A number of restraints were applied owing to disorder in the solvent molecules. In addition, the high $R_{1}$ and $w R_{2}$ factors of complexes $\mathbf{1}$ and 2 might be due to the weak high-angle diffractions and the disorder of some solvent molecules.

Complexes $\mathbf{1}$ and $\mathbf{2}$ are isomorphous. PLATON/SQUEEZE estimated the solvent-accessible region void to contain $(28.5+26.0+32.3+30.4)$ and $(17.7+17.4+16.7+17.5+21.7+22.0+21.8+22.3)$ electrons for complexes 1 and 2, respectively. The electron densities were tentatively modeled as two dma and four $\mathrm{CH}_{3} \mathrm{CN}$ molecules ( $\mathrm{z}=4$; half dma and one $\mathrm{CH}_{3} \mathrm{CN}$ molecules per asymmetric unit) which account for $(26+26+22+22+22+22)$ electrons. The final chemical formula of 1 and 2 were calculated from the SQUEEZE results combined with the elemental analyses data. ${ }^{\text {S4 }}$
