| 14. Superimposition of the IR spectra of the compounds of this work.....                                                                                                                                                                            | S21 |
| 15. Superimposition of the <sup>1</sup> H NMR spectra of the compounds of this work .....                                                                                                                                                           | S23 |

---

**Figure S1.** Double crown  $Cd_{10}O_{10}$  formed by ten  $\mu_3$ -phenoxo atoms of the Schiff base and the ten  $Cd^{II}$  ions (top) and view of molecular structure like a ten-blade propeller (bottom).

**Figure S2.** Labeling schemes for the two cations of **1** found in  $2[\text{Cd}_{10}(\text{L})_4(\text{HL})_6(\text{ClO}_4)_2(\text{CO}_3)](\text{ClO}_4)_4 \cdot 2\text{MeOH} \cdot 11\text{H}_2\text{O}$ . Each ligand preserves a labeling scheme (in the third figure) similar to that used in the free ligand (*vide infra*), while the two first figures correspond to those of the metal ligand that are chelating.

**Table S1.** Main bond distances [Å] for 2[Cd<sub>10</sub>(L)<sub>4</sub>(HL)<sub>6</sub>(ClO<sub>4</sub>)<sub>2</sub>(CO<sub>3</sub>)](ClO<sub>4</sub>)<sub>4</sub>·2MeOH·11H<sub>2</sub>O

### Experimental details for single crystal X-ray diffraction data.

Diffraction data for  $\text{H}_2\text{L} \cdot \text{MeOH}$ ,  $\text{Cd}(\text{HL})_2$  and  $2[\text{Cd}_{10}(\text{L})_4(\text{HL})_6(\text{ClO}_4)_2(\text{CO}_3)](\text{ClO}_4)_4 \cdot 2\text{MeOH} \cdot 11\text{H}_2\text{O}$  were collected at 100(2) K, using graphite-monochromated Mo-K $\alpha$  radiation ( $\lambda = 0.71073 \text{ \AA}$ ) from a fine focus sealed tube. Some significant crystal parameters and refinement data are summarized in Table S4. Data were processed and corrected for Lorentz and polarisation effects. Multi-scan absorption corrections were performed using the SADABS routine.<sup>1</sup> Structures were solved by standard direct methods using SIR2004,<sup>2</sup> and then were refined by full matrix least squares on  $F^2$  using SHELXL97.<sup>3</sup>

Both  $\text{Cd}(\text{HL})_2$  and  $2[\text{Cd}_{10}(\text{L})_4(\text{HL})_6(\text{ClO}_4)_2(\text{CO}_3)](\text{ClO}_4)_4 \cdot 2\text{MeOH} \cdot 11\text{H}_2\text{O}$  presented a very significant disorder. In the case of  $\text{Cd}(\text{HL})_2$ , each complex unit of  $\text{Cd}(\text{HL})_2$  can be found in the asymmetric unit on two different positions with 0.91:0.09 occupation sites, approximately. The case of the decanuclear complex is much more complicated, since crystals of  $2[\text{Cd}_{10}(\text{L})_4(\text{HL})_6(\text{ClO}_4)_2(\text{CO}_3)](\text{ClO}_4)_4 \cdot 2\text{MeOH} \cdot 11\text{H}_2\text{O}$  were twinned, so despite attempts to find a non-merohedral twin law, the structure was finally solved in the P1 space group as a racemic twin. Thus, the Flack parameter<sup>4</sup> refines with a 0.54(4) value (20688 Friedel pairs), indicating a 0.54:0.46 ratio between the non-centrosymmetric and centrosymmetric crystal domains. Furthermore, the unit cell contains two slightly different cations of  $[\text{Cd}_{10}(\text{L})_4(\text{HL})_6(\text{ClO}_4)_2(\text{CO}_3)]^{2+}$  that also appear to be disordered on two different sites (0.83:0.17) and (0.72:0.28), respectively. This could result from the twinning, or from a real disorder. In any case, the high density of disordered atoms with so different occupation, but in short proximity (in ranges 0.45–0.57 and 0.63–0.82  $\text{\AA}$  for the cadmium atoms), only allowed determining the disordered sites of the cadmium atoms, but not for the remaining atoms. With these difficulties, only heavy atoms (Cd and Cl) with high occupation sites could be anisotropically treated. All the other atoms were refined with an isotropic treatment, and very restrained. Hydrogen atoms of organic groups were included at geometrically calculated positions, with thermal parameters derived from the parent atoms. H atoms attached to water molecules or to groups suitable to form hydrogen bonds could not be located on Fourier maps, so their assignment to protonated imidazole residues was associated to logical H bonds. Finally, although many solvated molecules, some of them with partial occupation sites, could be modeled for  $2[\text{Cd}_{10}(\text{L})_4(\text{HL})_6(\text{ClO}_4)_2(\text{CO}_3)](\text{ClO}_4)_4 \cdot 2\text{MeOH} \cdot 2\text{H}_2\text{O}$ , but the additional contribution of the electron density of disordered solvate molecules (methanol or water) was subtracted from the measured structure factors using SQUEEZE.<sup>5</sup> Thus, up to nine voids are present in the unit cell, with volumes of less than 246  $\text{\AA}^3$ , meaning 216  $e^-$  in total.

CCDC 892600–892602 contain the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via [www.ccdc.cam.ac.uk/data\\_request/cif](http://www.ccdc.cam.ac.uk/data_request/cif)

### Computational details and coordinates for $[\text{Cd}_2(\text{L})(\text{HL})(\text{ClO}_4)(\text{MeOH})_2]$

The calculations were carried out at the DFT-B3LYP level with the Gaussian 09 program. The geometries were fully optimized by the gradient technique with the following basis: for Cd, the LANL2DZ basis set; for C, H, N, O and Cl were described by the standard polarized 6-31G\* basis set. The nature of the optimized structures was assessed through a frequency calculation and the changes of Gibbs free reaction energies ( $\Delta G$  values) were obtained by taking into account zero-point energies, thermal motion, and entropy contribution at standard conditions (temperature of 298.15 K, pressure of 1 atm).

### Perchlorate coordination modes

### Carbonate coordination modes

**Figure S6** Structurally characterised coordination modes of perchlorate and carbonate bridges, highlighting the unprecedented modes reported here.

## Experimental Section

Labelling scheme of H<sub>2</sub>L for NMR studies

**(*E*)-2-((1H-imidazol-2-yl)methyleneamino)phenol (H<sub>2</sub>L):** A solution of imidazole-2-carboxaldehyde (185 mg, 1.9 mmol) and 2-aminophenol (213 mg, 1.9 mmol) in methanol (60 mL) was heated under reflux for 8 h. The end of the reaction was observed by TLC. After cooling to room temperature, the resulting yellow solution was concentrated in vacuum to give a yellow crystalline product, which was washed with diethyl ether, filtered off and dried in vacuum. Yield = 343 mg (96%); <sup>1</sup>H NMR (500 MHz, dmso-*d*<sub>6</sub>):  $\delta$  12.95 (s, 1H; NH), 8.98 (s, 1H; OH), 8.64 (s, 1H; H-7), 7.46 (d, 1H, *J* = 8.0 and 1.4 Hz; H-5), 7.31 (br, 2H, H-9 and H-10), 7.11 (t, 1H, *J* = 8.1, and 1.5 Hz; H-3), 6.89 (d, 1H, *J* = 8.1 and 1.2 Hz; H-2), 6.82 (t, 1H, *J* = 8.0 and 1.3 Hz; H-4); <sup>13</sup>C NMR (125 MHz, dmso-*d*<sub>6</sub>):  $\delta$  152.4 (C-1), 146.6 (C-7), 145.7 (C-8), 134.9 (C-6), 130.8 (C-10), 128.6 (C-3), 119.9 (C-9), 119.6 (C-4), 117.6 (C-5) and 115.7 (C-2); FTIR (KBr, cm<sup>-1</sup>):  $\nu$ (O–H) 3373(s),  $\nu$ (N–H) 3144(m), 3117(m),  $\nu$ (C=N<sub>imine</sub>) 1624(s); MS (FAB<sup>+</sup>-MS, MNBA): *m/z* (%): 188.1 (100) [H<sub>2</sub>L + H]<sup>+</sup>; elemental analysis calcd (%) for C<sub>10</sub>H<sub>9</sub>N<sub>3</sub>O: C 64.2, H 4.8, N 22.4; found: C 64.3, H 4.9; N 22.4.

**Cd(HL)<sub>2</sub>·H<sub>2</sub>O** was obtained by stirring overnight a methanol solution (60 mL) containing H<sub>2</sub>L (134 mg, 0.7 mmol) and Cd(OAc)<sub>2</sub>·2H<sub>2</sub>O (94 mg, 0.35 mmol), at room temperature. This gave a yellow powder, which was filtered off and dried in vacuum. Alternatively, this reaction could be performed under reflux for 5 h when imidazole-2-carboxaldehyde (80 mg, 0.8 mmol) and Cd(ClO<sub>4</sub>)<sub>2</sub>·6H<sub>2</sub>O (168 mg, 0.4 mmol) were firstly mixed in methanol (50 mL) and then 2-aminophenol (87 mg, 0.8 mmol) was added to the resulting solution. Single crystals of Cd(HL)<sub>2</sub> were obtained from the mother liquor solution (methanol). Yield: 66%; <sup>1</sup>H NMR (250 MHz, dmso-*d*<sub>6</sub>):  $\delta$  13.14 (br, 2H; NH), 8.62 (s, 2H; H-7), 7.43 (d, 2H, *J* = 7.6 Hz; H-5), 7.43 (br, 2H; H-9), 7.19 (br, 2H; H-10), 7.09 (t, 2H, *J* = 7.6 Hz; H-3), 6.82 (d, 2H, *J* = 7.6 Hz; H-2), 6.70 (t, 2H, *J* = 7.6 Hz; H-4); FTIR (KBr, cm<sup>-1</sup>):  $\nu$ (O–H<sub>w</sub>) 3438 (m),  $\nu$ (N–H) 3061(w),  $\nu$ (C=N<sub>imine</sub>) 1588(m); MS (FAB<sup>+</sup>, MNBA): *m/z* (%): 485.1 (4) [Cd(HL)<sub>2</sub>+H]<sup>+</sup>, 298.0 (4) [CdL+H]<sup>+</sup>; elemental analysis calcd (%) for C<sub>20</sub>H<sub>18</sub>CdN<sub>6</sub>O<sub>3</sub>: C 47.8, H 3.6, N 16.7; found: C 47.5, H 3.4; N 16.8.

**Cd<sub>2</sub>(L)(HL)(OH)** was obtained by stirring a methanol solution (60 mL) containing H<sub>2</sub>L (187 mg, 1 mmol), Cd(ClO<sub>4</sub>)<sub>2</sub>·6H<sub>2</sub>O (209 mg, 0.5 mmol) and Cd(OAc)<sub>2</sub>·2H<sub>2</sub>O (266 mg, 1 mmol), at room temperature over a 24 h period. This gave a yellow powder, which was filtered off and dried in vacuum. Yield: 96 mg (63%); FTIR (KBr, cm<sup>-1</sup>):  $\nu$ (O–H) 3433 (m),  $\nu$ (N–H) 3040(w),  $\nu$ (C=N<sub>imine</sub>) 1603(m); MS (FAB<sup>+</sup>, MNBA): *m/z* (%): 614.9 (16) [M+H]<sup>+</sup>; elemental analysis calcd (%) for C<sub>10</sub>H<sub>8</sub>CdN<sub>3</sub>O<sub>1.5</sub>: C 39.2, H 2.6, N 13.7; found: C 39.5, H 2.4; N 13.4.

**2[Cd<sub>10</sub>(L)<sub>4</sub>(HL)<sub>6</sub>(ClO<sub>4</sub>)<sub>2</sub>(CO<sub>3</sub>)](ClO<sub>4</sub>)<sub>4</sub>·2MeOH·11H<sub>2</sub>O.** Single crystals of title compound were obtained in small amount by extended exposure of the methanol mother liquor of Cd<sub>2</sub>(L)(HL)(OH) to the atmosphere. The title compound was also obtained (after 24 h at ambient temperature) from Cd<sub>2</sub>(L)(HL)(OH) (1 equiv.) by passing a stream of carbon dioxide through a methanolic suspension after adding cadmium perchlorate (2 equiv.). <sup>1</sup>H NMR (250 MHz, dmso-*d*<sub>6</sub>):  $\delta$  8.70 (s, H-7), 7.18 (d, H-5), 7.10 (t, H-3), 6.90 (s, H-9 or H-10), 6.76 (s, H-9 or H-10), 6.59 (d, H-2), 6.31 (t, H-4); FTIR (KBr, cm<sup>-1</sup>):  $\nu$ (O–H) 3435 (sh),  $\nu$ (O–H<sub>MeOH</sub>) 3220,  $\nu$ (C=N<sub>imine</sub>) 1608(m),  $\nu$ (CO<sub>3</sub><sup>2-</sup>) 1463(s),  $\nu$ (CO<sub>3</sub><sup>2-</sup>) 1440(s),  $\nu$ (ClO<sub>4</sub><sup>-</sup>) 1144(s), 1113(vs), 618(m); elemental analysis calcd (%) for C<sub>204</sub>H<sub>182</sub>Cd<sub>20</sub>Cl<sub>8</sub>N<sub>60</sub>O<sub>71</sub>: C 34.3, H 2.5, N 11.8; found: C 34.0, H 2.7; N 11.5.

**Cd<sub>2</sub>(L)(HL)(ClO<sub>4</sub>)(MeOH)<sub>2</sub>** was obtained by stirring a methanol solution (60 mL) containing H<sub>2</sub>L (100 mg, 0.5 mmol) and Cd(ClO<sub>4</sub>)<sub>2</sub>·6H<sub>2</sub>O (223 mg, 0.5 mmol), at room temperature over a 4 h period. Concentration under reduced pressure of the yellow solution yielded an oily product, which was dried in vacuum and dissolved in diethyl ether (20 mL) and stirred during 30 min. This gave a brown powder, which was filtered off and dried in vacuum. Yield: 357 mg (60%); <sup>1</sup>H NMR (250 MHz, dmsO-*d*<sub>6</sub>): δ 8.67 (s, 2H; H-7), 7.43 (d, 2H, *J* = 8.0 and 1.4 Hz; H-5), 7.35 (br, 4H; H-9 and H-10), 7.13 (t, 2H, *J* = 8.2, and 1.5 Hz; H-3), 6.91 (d, 2H, *J* = 8.1 and 1.3 Hz; H-2), 6.83 (t, 2H, *J* = 8.0 and 1.3 Hz; H-4), 4.12 (s, 2H, *HO*<sub>MeOH</sub>) and 3.16 (s, 6H, *H*<sub>3</sub>*C*<sub>MeOH</sub>); FTIR (KBr, cm<sup>-1</sup>): ν(O-H<sub>MeOH</sub>) 3250 (m), ν(N-H<sub>imidazole</sub>) 3057(w), ν(C=N<sub>imine</sub>) 1619(m), ν(Cl-O) 1145(s), 1121(vs), 1087(vs), 636(m), 625(m); MS (MALDI-TOF, DCTB): *m/z* (%): 696.8 (100) [Cd<sub>2</sub>(L)(HL)(ClO<sub>4</sub>)+H]<sup>+</sup>; elemental analysis calcd (%) for C<sub>20</sub>H<sub>15</sub>Cd<sub>2</sub>ClN<sub>6</sub>O<sub>6</sub>·2MeOH: C, 34.8; H, 3.1; N, 11.1; found: C 35.1, H 3.4; N 11.1.
