Computational details:

Geometries of stationary points for the studied reaction and the model reaction were fully optimized using the M06-2X functional^{S1} with the 6-31G (d,p) basis set implemented in the Gaussian09 program^{S2}. Vibrational frequency calculation was carried out for each stationary point to verify whether it is a minimum or a transition state and obtain the thermodynamic data (enthalpy, entropy and Gibbs free energy) at 298.15K and 1atm. All the transition states were verified by intrinsic reaction coordinate (IRC)^{S3} calculations. The polarizable-continuum model (PCM)^{S4} was employed to compute the solvation Gibbs free energy for each species in the solvent (mesitylene) at its gas-phase optimized structure. To gain more accurate electronic energies, we carried out single point M06-2X calculations for stationary points of the encapsulated reaction and the model reaction. The large cc-pVTZ^{S5} basis set was employed for all the atoms.
