

## Highly Active Catalysts of Bisphosphine Oxides for Asymmetric Heck Reaction

Jian Hu, Yunpeng Lu, Yongxin Li and Jianrong (Steve) Zhou

E-mail: jrzhou@ntu.edu.sg

Supporting information: DFT calculation

### Computational Details

DFT calculations were carried out with the Gaussian 09 package [1]. Both olefin-catalyst complexes and transition structures are fully optimized by B3LYP [2] method using general basis set. The details of basis set are 6-31G+(d,p) [3] for H, C, O, F, and P, and LANL2DZ [4] with one f function for Pd. The LANL2 ECP is used for Pd. Harmonic frequency calculations are carried out to validate whether an optimized geometry is local minimum or transition state. All the geometries of the intermediates and transition states are also optimized in the dioxane solution using the PCM model [5].

### Computational Results and Discussions

Assuming the formation of olefin-complex was fast and reversible, our calculation indicated that IM1 and IM2 were two most stable species among olefin complexes. Others were much high in energy. During olefin insertion, the barrier from IM1 to TSa was 2-3 kcal/mol higher than that from IM2 to TS2, both in gas phase and in dioxane solution. The calculation results showed that, among various pathways, the one from IM2 to TS2 was the most favorable to form the major enantiomer of the Heck product.
