**General Procedures.** All manipulations were performed under a dry nitrogen or argon atmosphere using standard Schlenk techniques. Tetrahydrofuran (THF) was distilled under nitrogen from sodium/benzophenone. The elemental analyses were performed using a Carlo Erba Instruments CHNS-O EA 1108 analyzer. High Resolution Tandem Mass Spectrometry (Jeol LTD JMS-HX 110/110A) was performed at the Korean Basic Science Institute. The  $^1\text{H}$ ,  $^{11}\text{B}$ , and  $^{13}\text{C}$  NMR spectra were recorded on a Bruker600 spectrometer operating at 600.1, 150.9, and 192.6 MHz, respectively. All  $^{11}\text{B}$  chemical shifts were referenced to  $\text{BF}_3\cdot\text{O}(\text{C}_2\text{H}_5)_2$  (0.0 ppm) with a negative sign indicating an up-field shift. All proton and carbon chemical shifts were measured relative to the internal residual  $\text{CHCl}_3$  from the lock solvent (99.9%  $\text{CDCl}_3$ ). The absorption and photoluminescence spectra were recorded on a SHIMADZU UV-3101PC UV-VIS-NIR scanning spectrophotometer and a VARIAN Cary Eclipse fluorescence spectrophotometer, respectively. Decaborane, o-carborane, and 1-phenyl-o-carborane were purchased from Katchem and *N,N*-dimethylaniline, dichlorophenylborane, *n*-BuLi (2.5 M in hexane), chromium hexacarbonyl  $[\text{Cr}(\text{CO})_6]$ , and benzene-chromium(0) tricarbonyl $[(\eta^6\text{-Bz})\text{Cr}(\text{CO})_3]$  were purchased from Aldrich Chemicals.

**Crystal Structure Determination.** Crystals of **1**, **2**, **3**, and **4** were obtained from toluene, sealed in glass capillaries under argon, and mounted on the diffractometer. Preliminary examination and data collection were performed using a Bruker SMART CCD detector system single-crystal X-ray diffractometer equipped with a sealed-tube X-ray source (40 kV  $\times$  50 mA) using graphite-monochromated Mo  $\text{K}\alpha$  radiation ( $\lambda = 0.71073 \text{ \AA}$ ). Preliminary unit cell constants were determined with a set of 45 narrow-frame ( $0.3^\circ$  in  $\varphi$ ) scans. The double-pass method of scanning was used to exclude any noise. The collected frames were integrated using an orientation matrix determined from the narrow-frame scans. The SMART software package was used for data collection, and SAINT was used for frame integration.<sup>1</sup> Final cell

constants were determined by a global refinement of xyz centroids of reflections harvested from the entire data set. Structure solution and refinement were carried out using the SHELXTL-PLUS software package.<sup>2</sup>

**Cyclic voltammetry.** The cyclic voltammetry experiments were performed using a BAS 100 electrochemical analyzer. A three-electrode cell system containing a platinum disk, a platinum wire, and Ag/AgNO<sub>3</sub> as the working, counter, and reference electrodes, respectively, was used. All data were obtained for Ar-purged CH<sub>2</sub>Cl<sub>2</sub> solution containing 0.1M tetrabutylammonium perchlorate (TBAP) at a scan rate of 0.1 V s<sup>-1</sup>.

**Raman spectroscopy.** Raman spectra were obtained using a micro-Raman system (JY-Horiba, LabRam 300) with a collimated 50 x objective lens (Olympus, NA 0.75). This system is equipped with a thermoelectrically cooled charged-coupled device (CCD) detector and the signal was obtained by 180°backscattering geometry. The 647 nm line of CW Kr ion laser (Coherent, Innova 300C) was used as a Raman excitation source.

**Density Functional Calculations.** Full geometry optimizations of the complexes in their singlet ground state were performed with DFT using the B3LYP functional,<sup>3</sup> with the relativistic effective core potential and basis set LanL2DZ<sup>4</sup> for the chromium and the 6-31G<sup>5</sup>basis set for the remaining atoms. No symmetry constraints were applied during the geometry optimizations, which were carried out with the Gaussian 09 package.<sup>6</sup> The nature of the stationary points located was further checked by computations of harmonic vibrational frequencies at the same level of theory. All Isodensity plots (isodensity contour = 0.03 a.u.) of the frontier orbitals were visualized by Chem3D Ultraprogram.<sup>7</sup> The various properties of all compounds, such as HOMOs, LUMOs, and energy gaps were obtained from the computed results and were compared to the available experimental data. The excitation energies and oscillator strengths for the lowest 30 singlet–singlet transitions at the optimized geometry in the ground state were obtained in TDDFT calculations using the same basis set and functional

as for the ground state. Frequency calculations of all carboranes including Raman data were calculated by the same functional basis set using an optimized structure. Simulated absorption spectra and Raman spectra of all carborane compounds were obtained by GaussSum 2.2 program.<sup>8</sup>

**Synthesis of 1,2,3-triphenyl-o-carborane (1).** 1-Phenyl-o-carborane (1.10 g, 5.0 mmol) was added to a solution of KOH (0.84 g, 15 mmol) in 50 mL of ethanol and the clear reaction mixture was heated to reflux. TLC of the reaction mixture sample showed no starting material spot after that time. The reaction mixture was evaporated to dryness and re-dissolved in 50 mL of distilled water. An excess of Me<sub>4</sub>NCl was added to the reaction mixture and the precipitate of the tetramethylammonium nido-carborane salt formed was filtered off and dried using air suction (1.42 g, 100%). A 2.5 M solution of n-BuLi in hexane (1.0 mL, 2.2 mmol) was slowly added dropwise to a stirred solution of tetramethylammonium nido-carborane salt (0.57 g, 2.0 mmol) in 40 mL of THF at -78 °C, and then dichlorophenylborane (0.35 g, 2.2 mmol) was added *via* cannula. After this addition the reaction mixture was left to warm to room temperature and was then heated to reflux 6 h. The white precipitate of lithium chloride was removed by filtration in air and washed with THF. After evaporation the crude reaction mixture was purified by column chromatography (Hexane eluent) to give 1,2,3-triphenyl-o-carborane **1** and was then recrystallized from hexane to obtain a white powder.
