I. Experimental Section

I.1 Materials and instrumentations

All reagents were obtained from commercial suppliers and used without further purification unless otherwise indicated. All air and moisture-sensitive reactions were carried out under nitrogen atmosphere in oven-dried glassware. Glassware was dried in an oven at 100 °C and cooled under a stream of inert gas before use. Both dichloromethane and triethylamine were distilled over calcium hydride. ¹H NMR spectra were recorded on a Bruker DRX400 spectrometer and referenced to the residual proton signals of the solvent. HR-MS were recorded on a Bruker Daltonics microTOF-Q II spectrometer. All the solvents employed for the spectroscopic measurements were of UV spectroscopic grade (Aldrich).

I.2 Synthesis and characterisation

Boron-pyridyl-imino-isoindolines (**1**)

A solution of 3-iminoisoindolin-1-one (161 mg, 1.1 mmol) and 2-aminopyridine (104 mg, 1.1 mmol) in ethanol (10 ml) was heated under reflux for 20h, ammonia was evolved, when the solution was cooled, a colorless solid was precipitated. The crude product was dissolved in dry dichloromethane solution (100 ml) and treated with BF₃·OEt₂ (2.2 ml) in the presence of triethylamine (2 ml) at room temperature for 1 h. The reaction was quenched by adding water, the organic layer was dried over MgSO₄, filtered, and evaporated to dryness. The crude product was purified by silica-gel flash column chromatography (75% Hexane/Ethyl acetate) and recrystallized from CH₂Cl₂/hexane to provide **1** as colorless crystals (60 mg, 20%). ¹H NMR (400 MHz, CDCl₃) δ = 8.60 (d, *J* = 4.0 Hz, 1 H), 8.15 (t, *J* = 8 Hz, 1 H), 8.03 (t, *J* = 4.8 Hz, 1 H), 7.94 (t, *J* = 3.2 Hz, 1 H), 7.73–7.70 (m, 3 H), 7.48 (t, *J* = 6.4 Hz, 1 H); Uv/Vis (CH₂Cl₂), λ_{max} (ε) = 361 nm (24400 dm³ mol⁻¹ cm⁻¹); HRMS-ESI: *m/z*: calcd [C₁₃H₈BF₂N₃ONa]⁺ *m/z* = 294.0621; found *m/z* = 294.0622 [M+Na⁺], 272.0794, [M+H⁺], 252.0718, [M-F]⁺.

Compound **2** was obtained as yellow crystals in 22% yield by following a procedure similar to that of **1**. ^1H NMR (400 MHz, CDCl_3): δ = 8.91 (d, J = 9.6 Hz, 1 H), 8.45 (d, J = 8.8 Hz, 1H), 8.07 (t, J = 4.8 Hz, 1 H), 7.98 (d, J = 4.8 Hz, 1 H), 7.90 (d, J = 7.2 Hz, 2 H), 7.76 (m, 2 H), 7.69 (m, 2 H); Uv/Vis (CH_2Cl_2), λ_{max} (ϵ) = 387 nm ($26700 \text{ dm}^3 \text{ mol}^{-1} \text{ cm}^{-1}$); HRMS-ESI: m/z : calcd $[\text{C}_{17}\text{H}_{10}\text{BF}_2\text{N}_3\text{ONa}]^+$ m/z = 344.0777; found m/z = 344.0782 $[\text{M}+\text{Na}^+]$.

Compound **3** was obtained as a light yellow solid in 18% yield by following a procedure similar to that of **1**. ^1H NMR (400 MHz, CDCl_3): δ = 8.61 (m, 1 H), 8.55 (s, 1 H), 8.47 (s, 1 H), 8.14 (t, J = 7.2 Hz, 1 H), 8.08 (m, J = 3.6 Hz, 2 H), 7.71 (t, J = 8.0 Hz, 3 H), 7.46 (t, J = 7.0 Hz, 1 H); Uv/Vis (CH_2Cl_2), λ_{max} (ϵ) = 396 nm ($31700 \text{ dm}^3 \text{ mol}^{-1} \text{ cm}^{-1}$); HRMS-ESI: m/z : calcd $[\text{C}_{17}\text{H}_{10}\text{BF}_2\text{N}_3\text{ONa}]^+$ m/z = 344.0777; found m/z = 344.0780 $[\text{M}+\text{Na}^+]$, 322.0961, $[\text{M}+\text{H}^+]$.

Compound **4** was obtained as yellow crystals in 19% yield by following a procedure similar to that of **1**. ^1H NMR (400 MHz, CDCl_3): δ = 8.91 (m, 1 H), 8.61 (s, 1 H), 8.49 (s, 1H), 8.44 (d, J = 8.8 Hz, 1 H), 8.10 (m, 2 H), 7.91 (t, J = 7.6 Hz, 2 H), 7.65- 7.73 (m, 4 H); Uv/Vis (CH_2Cl_2), λ_{max} (ϵ) = 419 nm ($47500 \text{ dm}^3 \text{ mol}^{-1} \text{ cm}^{-1}$). HRMS-ESI: m/z : calcd $[\text{C}_{21}\text{H}_{12}\text{BF}_2\text{N}_3\text{ONa}]^+$ m/z = 394.0934; found m/z = 394.0954 $[\text{M}+\text{Na}^+]$.

I.3 X-ray structure determination

The X-ray diffraction data were collected on a Bruker Smart Apex CCD diffractometer with graphite monochromated Mo $K\alpha$ radiation (λ = 0.71073 Å) using the ω -2 θ scan mode. The structure was solved by direct methods and refined on F^2 by full-matrix least-squares methods using SHELX-2000.^{S1-S2} All calculations and molecular graphics were carried out on a computer using the SHELX-2000 program package and Diamond 3.2.

1: $\text{C}_{13}\text{H}_8\text{BF}_2\text{N}_3\text{O}$; A colorless block-like crystal of the approximate dimensions $0.22 \times 0.20 \times 0.20 \text{ mm}^3$ was measured. Monoclinic, space group $\text{P}2(1)/c$, a = 7.1416(9) Å, b = 8.4969(11) Å, c = 19.655(3) Å, α = 90, β = 99.473(2), γ = 90, V = 1176.4(3)

4: $\text{C}_{21}\text{H}_{12}\text{BF}_2\text{N}_3\text{O}$: A yellow block-like crystal of the approximate dimensions $0.26 \times 0.20 \times 0.18 \text{ mm}^3$ was measured. Monoclinic, space group $P2(1)/c$, $a = 15.707(17) \text{ \AA}$, $b = 15.0371(16) \text{ \AA}$, $c = 16.4939(18) \text{ \AA}$, $\alpha = 90$, $\beta = 112.855(2)$, $\gamma = 90$, $V = 3589.8(7) \text{ \AA}^3$, $Z = 4$, $F(000) = 1688.0$, $\rho = 1.531 \text{ Mgm}^{-3}$, $R_1 = 0.0420$, $wR_2 = 0.1221$, $\text{GOF} = 1.020$, residual electron density between 0.521 and $-0.562 \text{ e\AA}^{-3}$.

CCDC No. 968011 for **1**, No. 968012 for **2** and No 968013 for **4** containing the supplementary crystallographic data for this paper. These data can be obtained free of charge via www.ccdc.cam.ac.uk/conts/retrieving.html (or from the Cambridge Crystallographic Data Centre, 12 Union Road, Cambridge CB21EZ, UK; fax: (+44)1223-336-033; E-mail: deposit@ccdc.cam.ac.uk).

1.4 Spectroscopic measurements

UV-visible absorption spectra were recorded on a Shimadzu 3000 spectrophotometer. Fluorescence spectra were measured on a Hitachi F-2700 luminescence spectrometer with a 150 W xenon lamp. The fluorescence lifetimes and the absolute quantum yields (Φ_F) of the samples were determined with a Horiba Jobin Yvon Fluorolog-3 spectrofluorimeter. Absorption and emission measurements were carried out in $1 \times 1 \text{ cm}$ quartz cuvettes. Drop casting films were prepared by evaporation of the dye (1 mM) in dichloromethane onto a clean silicon wafer substrates, then the absorption spectras were measured in Shimadzu 3000 spectrophotometer by a general method. The absolute quantum yields and emission spectra in the solid state were measured in

Supplementary Material (ESI) for Chemical Communications
This journal is © The Royal Society of Chemistry 2013

Horiba Jobin Yvon Fluorolog-3 spectrofluorimeter with integrating sphere. Those films were stable and no change in absorption and emission was observed over an extended period of time. For all measurements, the temperature was kept constant at (298 ± 2) K. Dilute solutions with absorbance of less than 0.05 at the excitation wavelength were used for the measurement of fluorescence quantum yields. 9,10-Diphenylanthracene was used as the standard ($\Phi_F = 0.90$ in cyclohexane).^{S3} The quantum yield, Φ , was calculated using equation (1):

$$\Phi_{sample} = \Phi_{std} \left[\frac{I_{sample}}{I_{std}} \right] \left[\frac{A_{std}}{A_{sample}} \right] \left[\frac{n_{std}^2}{n_{sample}^2} \right] \quad (1)$$

where the *sample* and *std* subscripts denote the sample and standard, respectively, I is the integrated emission intensity, A stands for the absorbance, and n is refractive index.

When the fluorescence decays were monoexponential, the rate constants of radiative (k_f) and nonradiative (k_{nr}) deactivation were calculated from the measured fluorescence quantum yield (Φ_F) and fluorescence lifetime (τ) according to equations (2) and (3):

$$k_f = \Phi_F / \tau \quad (2)$$

$$k_{nr} = (1 - \Phi_F) / \tau \quad (3)$$

1.5 DFT calculations

The G09W software package was used to carry out a DFT geometry optimization using the CAM-B3LYP functional with 6-31G(d) basis sets.^{S4} The same approach was used to calculate the absorption properties based on time-dependent (TD-DFT) method.
