<b>Section 3</b>	<b>Supplementary Physical Characterizations</b>

## ***Section 1 Experimental Section***

**Materials and general methods.** All chemicals were commercially purchased and used without further purification.  $\text{K}_7\text{HNb}_6\text{O}_{19}\cdot 13\text{H}_2\text{O}$  was prepared according to the literature and identified by IR spectra.<sup>4c</sup> Elemental analysis for Nb, V, P and Cu were determined by a Leaman inductively coupled plasma (ICP) spectrometer. IR spectra were recorded in the range 400-4000  $\text{cm}^{-1}$  on an Alpha Centaur FT/IR Spectrophotometer using KBr pellets. Solid state UV-vis absorption spectra were recorded from 200 to 900 nm using barium sulfate ( $\text{BaSO}_4$ ) as a standard with 100% reflectance on a Varian Cary 500 UV-Vis spectrophotometer. Emission/excitation spectra were recorded on a HITACHI F-7000 fluorescence spectrophotometer. Powder X-ray diffraction measurement was recorded at room temperature on a Siemens D5005 diffractometer with  $\text{Cu-K}\alpha$  ( $\lambda = 1.5418 \text{ \AA}$ ). Thermogravimetric analysis (TGA) of the samples were performed using a Perkin-Elmer TG-7 analyzer heated from 55  $^\circ\text{C}$  to 900  $^\circ\text{C}$  under nitrogen at the heating rate of 10  $^\circ\text{C}\cdot\text{min}^{-1}$ .

**Synthesis of 1.**  $\text{Cu}(\text{Ac})_2\cdot 2\text{H}_2\text{O}$  (0.044 g, 0.200 mmol) was added to 2 mL distilled water with stirring. Then the resulting blue solution was added dropwise to a 4 mL aqueous solution containing  $\text{K}_7\text{HNb}_6\text{O}_{19}\cdot 13\text{H}_2\text{O}$  (0.045 g, 0.033 mmol),  $\text{NaVO}_3$  (0.049 g, 0.400 mmol) and  $\text{H}_3\text{PO}_4$  (5 M, 0.030 mL, 0.150 mmol). The mixture was adjusted to pH 9.50 using 1 M NaOH solution. Subsequently, en was used to adjust the pH value of mixture to 10.50, and the mixture was transferred to a Teflon-lined stainless steel autoclave (23 mL). The Teflon-lined stainless steel autoclave was heated at 160  $^\circ\text{C}$  for 72 h, and was then cooled to room temperature at a rate of 10  $^\circ\text{C}/\text{h}$ . Brown block-like crystals of **1** were obtained from the solid product in a yield of 39.8% (based on Nb). Anal. For **1**: Calcd (%): P 0.98, Cu 8.08, V 9.71, Nb 35.43. Found (%): P 1.05, Cu 8.22, V 9.46, Nb 35.27. **Synthesis of 2.** **2** was prepared according to the similar method of **1**, except enMe was used instead of en. After

cooling to room temperature, brown block-like crystals were collected. Yield: ca. 58.3% (based on Nb). Anal. For **2**: Calcd (%): P 0.96, Cu 7.87, V 9.47, Nb 34.54. Found (%): P 1.02, Cu 8.06, V 9.21, Nb 34.69.

### **X-ray Crystallography**

The crystal data of **1** and **2** were collected on a Rigaku R-AXIS RAPID IP diffractometer (Mo $K_{\alpha}$ , graphite monochromator,  $\lambda = 0.71073 \text{ \AA}$ ). The structures were solved by the direct method and refined by the full-matrix least-squares method on  $F^2$  using the SHELXTL-97 crystallographic software package.<sup>S1</sup> During the refinement, all H atoms on water molecules were directly included in the molecular formula. Hydrogen atoms of organic ligands were fixed in the calculated positions. The crystal data and structure refinements of compounds **1** and **2** are summarized in Table S1. CCDC reference numbers are 973046 and 973047 for **1** and **2**, respectively. The data can be obtained free of charge from the Cambridge Crystallographic Data Centre via [www.ccdc.cam.ac.uk/datarequest/cif](http://www.ccdc.cam.ac.uk/datarequest/cif).

## **Photocatalytic Experiments**

**The UV photocatalytic experiments with irradiation of 125 W Hg lamp.** The photocatalytic reactions were carried out in a Pyrex inner-irradiation-type reaction vessel with magnetic stirring at room temperature. The photocatalytic reactions were performed in 100 mL 20% CH<sub>3</sub>OH aqueous solution, containing 100 mg photocatalyst and loading 0.75% Pt. Before the photocatalytic reaction, nitrogen gas was bubbled through the reaction mixture for 0.5 h to remove air. The mixture was then irradiated using a 125 W Hg lamp, and the produced H<sub>2</sub> was analyzed using a GC 7890T instrument.

**The photocatalytic experiments with irradiation of 300 W Xe lamp.** This photocatalytic experiments were performed similar to the UV process, except a 300 W Xe lamp (without filter) was used instead of 125 W Hg lamp. Before the photocatalytic reaction, vacuum pump was bubbled through the reaction mixture for 0.5 h to remove air.

**Table 1** Crystal Data and Structure Refinement for **1 - 2**.

**Section 3**      **Supplementary Physical Characterizations**

Fig. S6. The XPS spectra of **1** and **2** each give one peak at 515.76 eV for **1**, and 515.79 eV for **2**, which can be ascribed to  $V^{4+} 2p_{3/2}$ , respectively.<sup>11a</sup>

Fig. S7. The solid state UV/Vis absorption spectra of compound **1**(black) and **2** (red).

Fig. S8. The IR spectra of **1** (black) and **2**(red).

The IR spectra of **1** and **2** are recorded between 400 and 4000  $\text{cm}^{-1}$  with a KBr pellet, which could be used for identification of the characteristic vibration bands of PONs and organic components in products. In the IR spectra, the terminal  $\text{M} = \text{O}_t$  ( $\text{M} = \text{V}$ ,  $\text{Nb}$ ) vibrations appear at 961  $\text{cm}^{-1}$  and 874  $\text{cm}^{-1}$  for **1** and at 964 and 875  $\text{cm}^{-1}$  for **2**, respectively.<sup>10,11</sup> The characteristic peaks at 678 and 453  $\text{cm}^{-1}$  (**1**) and 675 and 452  $\text{cm}^{-1}$  (**2**) are attributed to the bridging  $\text{Nb}-\text{O}_b-\text{Nb}$  vibrations, respectively.<sup>4-6</sup> Bands at 1059  $\text{cm}^{-1}$  for **1** and 1060  $\text{cm}^{-1}$  for **2** are assigned to  $\text{P}-\text{O}_c$  vibration, respectively.<sup>S4</sup> Bands in the 1170–1598  $\text{cm}^{-1}$  (**1**) and 1172–1593  $\text{cm}^{-1}$  (**2**) region are attributed to the organic amine groups.<sup>10-13</sup>

S4 M. Nyman, A. J. Celestian, J. B. Parise, G. P. Holland and T. M. Alam, *Inorg. Chem.*, 2006, **45**, 1043.

Fig. S9. The TGA curves of **1** and **2**.

To investigate the thermal stabilities of compounds **1** and **2**, thermogravimetric analyses (TGA) were carried out under a nitrogen atmosphere with a heating rate of 10 °C/min. Three continuous weight losses steps were observed on the TGA curve of **1**. The first weight loss of 7.37% (calcd. 7.28%) in the range 55–232°C is attributed to the removal of lattice water molecules and OH<sup>-</sup> groups. And the other two weight loss of 10.13% from 232 to 767°C and 6.55% from 767 to 900°C all come from the release of eight en ligands (calcd. 15.28%). For **2**, the first weight loss of 5.86% (calcd. 5.98%) in the range 55–240°C is attributed to the removal of six lattice water molecules and five OH<sup>-</sup> groups. And the other two weight loss of 12.27% from 225 to 767°C, and 7.17% from 767 to 900°C all come from the release of eight enMe ligands (calcd. 18.37%).
