## Supplementary Information

## Uniaxial negative thermal expansion facilitated by weak host-guest interactions

## Materials

The 18-crown-6 and nitromethane were purchased from Sigma-Aldrich. Methyl iodide was obtained from Merck. All chemical were used as received.

## Synthesis

The methyl iodide solvate $\left(\mathrm{C}_{12} \mathrm{H}_{24} \mathrm{O}_{6} \cdot 2 \mathrm{CH}_{3} \mathrm{I}\right)$ was prepared from a concentrated solution of 18-crown-6 in neat methyl iodide. The solution was stirred for 2 hours at room temperature after which it was stored at ca. $5^{\circ} \mathrm{C}$ for slow evaporation. Crystals were obtained after 5 days.

## Single crystal X-ray diffraction

Single crystal X-ray diffraction data were collected using a Bruker APEX-II Quasar CCD area-detector diffractometer equipped with an Oxford Cryosystems 700Plus cryostat. A multilayer monochromator with $\mathrm{MoK} \alpha$ radiation $(\lambda=0.71073 \AA$ ) from an Incoatec $\mathrm{I} \mu \mathrm{S}$ microsource was used.

Data reduction was carried out by means of the standard procedure using the Bruker software package SAINT2 and the absorption corrections and the correction of other systematic errors were performed using SADABS. 3 The structures were solved by direct methods using SHELXS-97 and refined using SHELXL-97.4 X-Seed5 was used as the graphical interface for the SHELX program suite. Hydrogen atoms were placed in calculated positions using riding models.

## Cryogenic Powder X-ray Diffraction Powdered

Cryogenic powder X-ray diffraction samples were placed in a sealed glass capillary. X-ray powder diffractograms were measured using $\mathrm{Cu} \mathrm{K} \alpha$ radiation ( $\lambda=1.5418 \AA, 40 \mathrm{kV}$ and 30 mA ) on a PANalytical instrument operating in Bragg-Brentano geometry. The first diffractogram ( $2 \theta$ range from $5^{\circ}$ to $40^{\circ}$ ) was measured at K , after which successive patterns were measured at 20 K intervals. The sample was cooled at a rate of $0.7 \mathrm{~K} \mathrm{~min}-1$ between measurements.

Figure S3: Temperature-resolved powder diffraction patterns for the same sample of 18C6N over the range 123K-273K.

## Differential Scanning Calorimetry (DSC)

DSC experiments were carried out on a TA Instruments Q100 with Liquid Nitrogen Cooling Accessory (LNCS) and a Q20 with Refrigerated Cooling System (RCS90). The 18C6N sample was cooled from $0{ }^{\circ} \mathrm{C}$ to $-150{ }^{\circ} \mathrm{C}$ and subsequently heated to $0{ }^{\circ} \mathrm{C}$ at a rate of $5{ }^{\circ} \mathrm{C} / \mathrm{min}$. The nitromethane sample was cooled from $0{ }^{\circ} \mathrm{C}$ to $-85^{\circ} \mathrm{C}$ and subsequently heated to $0^{\circ} \mathrm{C}$ at a rate of $5^{\circ} \mathrm{C} / \mathrm{min}$.

Figure S4: DSC curves for 18C6N and neat nitromethane.

## Computational

Atomic coordinates were imported from the refined crystal structures. Only the hydrogen atoms in the framework were optimized as part of a periodic system using the CASTEP module of the Materials Studio software suite. ${ }^{1}$ The optimizations were performed using the GGA PBE functional with Grimme's DFT-D dispersion correction and thresholds for geometry optimization and SCF convergence were chosen as $1 \times 10^{-5}$ and $1 \times 10^{-6} \mathrm{eV}$ respectively. The hydrogen optimized crystal structures were then used to determine H -bond angles (Figure S4). Single point energies calculations using the DMol3 module of the Materials Studio Software suite were performed using the GGA PBE functional with Grimme's DFT-D dispersion correction and threshold for SCF convergence were chosen as $1 \times 10^{-6} \mathrm{eV}$. The electron density data obtained from the DMol3 calculations were used to construct the three dimensional $0.01 \mathrm{e}^{-} / \AA^{3}$ electron density contour used for the molecular electrostatic potential map (obtained from the same calculation). The 18C6-guests and guest-guest interaction energies were calculated using DFT (Guassian09). ${ }^{2}$ The hydrogen atoms which were fully optimized at the mPW1PW91/QZVP level of theory as well as the C-N and C-I bonds in nitromethane and iodomethane respectively. Although the change in bond length was small, it was required to achieve a geometry convergence.

Subsequent single point energies were performed at MP4/QZVP level of theory in order to determine the interaction energies.

## PASCal

PASCal calculations were carried out online at http://pascal.chem.ox.ac.uk using the Eulerian finite strain setting.

Figure S6: Expansivity indicatrix generated in PASCal.

## Thermogravimetric analysis (TGA)

Thermogravimetric analysis was carried out using a TA Instruments Q500. The sample was heated at $10{ }^{\circ} \mathrm{C} / \mathrm{min}$ from room temperature to decomposition. The experimental $32.5 \%$ is in agreement with the expected 31.6 \%.based on single-crystal X-ray analysis.

Figure S7: TGA curve for 18C6N.
