General Considerations.

NMR spectra were acquired on a Bruker AC-300 instrument at 300 and 75.5 MHz for ¹H and ¹³C NMR, respectively. Chemical shifts (δ) are reported in parts per million relative to residual solvent signals (CDCl₃, 7.26 ppm for ¹H NMR and 77.0 ppm for ¹³C NMR spectra; MeOH-d₄ 3.31 ppm for ¹H NMR and 49.0 ppm for ¹³C NMR). ¹³C NMR spectra were acquired on a broad-band decoupled mode. Optical rotations were measured on a PerkinElmer 241 polarimeter. Mass spectra (MS) were obtained by ESI or FAB+ (matrix: *m*-NBA) ionization mode. High resolution mass spectra (HRMS) were performed by ESI ionization mode using a time of-flight (TOF) mass analyzer or FAB+ ionization mode. Analytical thin layer chromatography (TLC) was performed using precoated aluminum-packed plates (Merck Kieselgel 60 F254) and visualized by ultraviolet irradiation or phosphomolybdic acid dip. Flash column chromatography was performed using silica gel (230–400 mesh). All reactions were carried out in anhydrous solvents. THF and CH₂Cl₂ were dried with molecular sieves. Commercially available starting materials were used without purification.

Sulfinimine **3** was prepared from 2-bromobenzaldehyde and (*R*)-*tert*-butanesulfinamide, according to the known literature procedure.¹ The characterization was effected by comparison of its physical and spectroscopic data with those reported.²

Radical Addition. General procedure

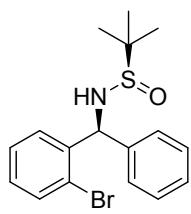

To a solution of sulfinimine **3** (0.2 mmol) in DCM (3 mL, 0.04M), under argon atmosphere, was added BF₃·OEt₂ (0.42 mmol, 2.1 equiv). After 5 min under stirring, the mixture was cooled to -78 °C and then, the alkyl iodide (2.0 mmol, 10 equiv), tributyltin hydride (0.5 mmol, 2.5 equiv), triethylborane (0.5 mmol, 1M hexane, 2.5 equiv) and O₂ (5 mL, via syringe) were added in this order. Successive additions of triethylborane (0.25 mmol, 1M hexane) and O₂ (5 mL, via syringe) were added every 1 or 1.5 hour until the imine disappearance (TLC). Then, the reaction was treated with aq. NaHCO₃ solution. The aqueous phase was extracted with DCM (3x5mL). The organic extracts were washed with brine and dried over MgSO₄. The solvent was removed under reduced pressure and the residue purified by flash chromatography on silica gel:KF (9:1) with a 1:1 mixture of *n*-hexane:ethyl acetate as the eluent.

Sulfinamides **4a-d**³ were prepared from the corresponding alkyl iodide according to the above general procedure with the following isolated yields: **4a** (R=Et, 80 %), **4b** (R=*i*Pr, 91 %), **4c** (R=Cy, 90 %), **4d** (R=*t*Bu, 75 %).
