General Experimental Information

Unless otherwise specified, all manipulations were carried out under an atmosphere of dry argon in oven-dried glassware, or under a nitrogen atmosphere in a glovebox (M. Braun) with oxygen and water levels ≤ 2 ppm. All solvents were distilled from either CaH₂ or Na, deoxygenated with a minimum of three freeze-pump-thaw cycles and stored under N₂ over molecular sieves (4Å) prior to use. Pinacolborane was purchased from Sigma Aldrich and purified by short path distillation and stored at -30 °C under a nitrogen atmosphere. 2-Phenylpyridine was purchased from Sigma Aldrich, distilled from CaH₂ and stored at -30 °C under a nitrogen atmosphere. 2-Phenylpyridines (**4a–n**) were synthesized according to literature procedures.^{1,2} [Rh(IPr)(C₂H₄)Cl]₂ (**1**) was prepared according to our previously reported synthesis³ and stored at -30 °C under a nitrogen atmosphere. Addition of water for the arylation reactions was accomplished by bubbling Ar through distilled water for a minimum of 30 minutes and adding the water to the reaction mixture with a μ L glass syringe. RhCl₃ and Pd₂(dba)₃ were generously donated by Johnson Matthey and used without further purification. NMR spectra were recorded on a Bruker Avance 400 or 500 MHz (¹H) where indicated. Chemical shifts are reported in delta (δ) units, expressed in parts per million (ppm) downfield from tetramethylsilane using residual protonated solvent as an internal standard (CDCl₃, δ 7.26 ppm; CD₂Cl₂, δ 5.32 ppm; C₆D₆, δ 7.16 ppm). Boron NMR spectra (¹¹B) were recorded at 128 MHz and 160 MHz and referenced to an external standard (BF₃·OEt, δ 0 ppm). Purification of C–H borylation products was achieved by column chromatography using a stationary phase of Aluminum oxide purchased from Sigma Aldrich (activated, basic, Brockmann Grade I, 58 Å porosity, pH 9.0–10.0) and eluted with reagent grade hexanes and ethyl acetate (EtOAc). Purification of the arylated products was achieved on column chromatography using flash grade silica gel (Silicycle, 50 μ m particle size, 60 Å porosity) and eluted with reagent grade mixtures of hexanes/EtOAc or DCM/MeOH. Elemental analyses were performed using a Thermo Scientific Flash 2000 CHNS Elemental Analyzer. High-resolution mass spectrometry (HRMS) was performed using a Micromass GCT (GC–Time of Flight Mass Spectrometer). X-ray data collection was performed on a Bruker SMART APEX II X-ray diffractometer.

Synthesis of $[\text{Rh}(\text{IPr})(\text{C}_2\text{H}_4)\text{Cl}]_2$ (**1**)³

In a nitrogen–filled glovebox, a 4 dram vial equipped with a stir bar was charged with $[\text{Rh}(\text{C}_2\text{H}_4)_2\text{Cl}]_2$ (30 mg, 0.08 mmol), which was taken up in THF (6 mL). *N,N'*–bis(2,6–diisopropylphenyl)–imidazol–2–ylidene (60 mg, 0.16 mmol) in THF (6 mL) and added drop–wise, and the solution was stirred for 3 hours at room temperature. The reaction was then filtered through a plug of Celite and the THF was removed *in vacuo*. The residue was triturated with hexanes to afford 87 mg of an orange–yellow powder (87 mg, 98% yield). Complex **1** was stored as a powder at –30 °C under nitrogen. Spectral data are consistent with that which we have previously reported.¹

Synthesis of $[\text{Rh}(\text{IPr})(2\text{-Ph-Pyr})\text{HCl}]$ (**3a**)

In a nitrogen–filled glovebox, 2-phenyl pyridine (4.2 mg, 0.027 mmol) in C_6D_6 (2.0 mL) was added to a solution of **1** (15 mg, 0.013 mmol) in C_6D_6 (2.0 mL) and the mixture was allowed to stir for 3 days. The formation of a new rhodium hydride complex was confirmed by ^1H NMR (500 MHz, C_6D_6) which displayed the characteristic doublet -24.5 ppm, $^1J_{\text{Rh-H}} = 48.9$ Hz.

Synthesis of $[\text{Rh}(\text{IPr})(2,2'\text{-Biquinoline})\text{HCl}]$ (**3b**)

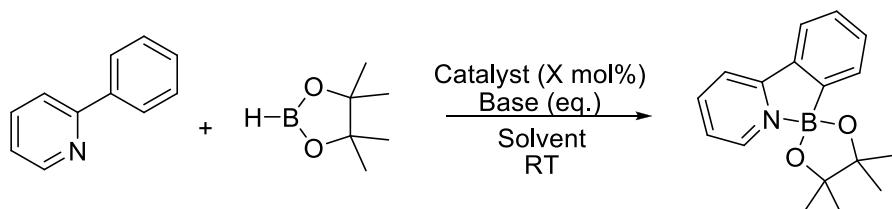

In a nitrogen–filled glovebox, 2,2’–biquinoline (7 mg, 0.026 mmol) in C_6D_6 (2.0 mL) was added to a solution of **1** (15 mg, 0.013 mmol) in C_6D_6 (2.0 mL) and the solution was allowed to stir at RT for 10 days which resulted in an intractable mixture according to ^1H NMR. The C_6D_6 was evaporated. A co–crystal of compounds **3b** and **3c** in a ratio of 3:2 respectively was obtained by a slow diffusion of hexanes into a concentrated THF solution of the mixture.

Optimization of C–H Borylation on Phenyl Pyridine

General Optimization Procedure

To an oven-dried round bottom flask containing a stir bar, base was added followed by substrate (0.13 mmol), pinacolborane and **1** in the indicated solvent at the indicated concentration. The mixture was vigorously stirred for the indicated time at room temperature. The solution was filtered through celite, and the solvent was removed under reduced pressure. Yields were determined by ^1H NMR using 1,4, dimethoxybenzene as an internal standard.

General Procedure for C–H Borylation of 2–Phenylpyridines (5a–5n)

General Arylation Procedure for the one-pot C–H Borylation and Suzuki–Miyaura Cross–Coupling of 2–Phenylpyridines (**6a–h**)

To an oven dried 50 mL round bottom flask equipped with a stir bar, NaOEt (8.5 mg, 0.125 mmol) was added. In separate vials, **1** (5.55 mg, 0.005 mmol, 1 mol%) and phenyl pyridine (0.5 mmol) were each taken up in 2 mL of benzene each and sequentially added to the round bottom flask. HBpin (128 mg, 1 mmol) was taken up in 0.6 mL of benzene and added to the stirring

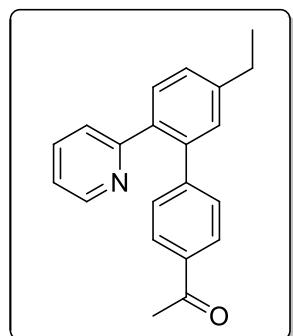

solution (total reaction volume = 4.6 mL, 0.11 M concentration). The flask was sealed with a septum and vigorously stirred in the glovebox for 4 hours. After this time, aryl bromide (0.55 mmol, 1.1 eq), K_2CO_3 (207 mg, 1.5 mmol), $[HP'Bu_3][BF_4]$ (14.5 mg, 0.05 mmol, 10 mol%) and $Pd_2(dba)_3$ (11.5 mg, 0.0125 mmol, 2.5 mol%) were added to the reaction mixture. The flask was sealed with a rubber septum and removed from the glove box. Degassed H_2O (27 μ L, 1.5 mmol) was added through the septum via syringe. The reaction flask was placed in an oil bath at 60 °C and allowed to stir for 18 hours. Afterwards, the mixture was allowed to cool to room temperature and filtered through Celite in EtOAc. The filtrate was concentrated and the product isolated by column chromatography on silica gel. Occasionally, traces of pinacol are present in the 1H NMR spectra of compounds **6a–6h**.

NOTE:

All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
