1.0 General Experimental Procedures

C, H, and N analyses were carried out with a Carlo Erba instrument. IR spectra were recorded on a Perkin-Elmer spectrophotometer 16F PC FT-IR, using Nujol mulls between polyethylene sheets. NMR spectroscopic data of complexes (^1H , ^{31}P and ^{19}F) were recorded on Bruker Avance 300 spectrometer. ESI-MS Accurate mass TOF analyses were performed on an Agilent VL mass spectrometer. The ionization mechanism used was electrospray in positive and negative ion full scan mode using acetonitrile as solvent and nitrogen gas for desolvation.

2.0 X-ray Data Collection, Structure Solution, and Refinement for (2) $[\text{Pd}(\text{Phbz})(2,4,6\text{-F}_3\text{C}_6\text{H}_2)(\text{PPh}_3)]$, (3) $[\text{Pd}(\text{Phazb})(2,4,6\text{-F}_3\text{C}_6\text{H}_2)(\text{PPh}_3)]$, (4) $[\text{Pd}_2(2,4,6\text{-C}_6\text{F}_3\text{H}_2)_2(\text{PPh}_3)_2(\mu\text{-OH})(\mu\text{-OAc})]$ and (5) *trans*- $[\text{PdCl}(2,4,6\text{-F}_3\text{C}_6\text{H}_2)(\text{PPh}_3)]$

Data collection for were obtained at 100(2) K on a Bruker Smart CCD diffractometer with a nominal crystal to detector distance of 4.5 cm. Diffraction data were collected based on a ω scan run. A total of 2524 frames were collected at 0.3° intervals and 10 s per frame. The diffraction frames were integrated using the SAINT package¹ and corrected for absorption with SADABS.² The structures were solved by direct methods and refined by full-matrix least-squares techniques using anisotropic thermal parameters for non-H atoms (Table 1).

3.0 Materials and methods

The cyclometallated starting materials $[\text{Pd}(\text{Phbz})(\text{AcO})(\text{PPh}_3)]$, $[\text{Pd}(\text{Phbz})(\text{succinimidate})(\text{PPh}_3)]$ and $[\text{Pd}(\text{Phbz})(\text{maleimidate})(\text{PPh}_3)]$ were synthesized following a reported method³ The commercially available chemicals were purchased from Aldrich Chemical Co. and were used without further purification, and all the solvents were dried by standard methods before use.

3.1 Characterization of [Pd(Phbz)(AcO)(PPh₃)] (0.092 g, 75%). Anal. Found: C, 65.3; H, 4.7; N, 2.5. Calc. for C₃₃H₂₈NO₂PPd: C, 65.2; H, 4.6; N, 2.3%. IR (cm⁻¹): ν (C=O) 1594vs, ν (Phbz) 1546s, ν (PPh₃) 532, 517. ESI-MS (positive mode) m/z: 548 M⁺-AcO. ¹H NMR. δ _H (300 MHz, CDCl₃): 8.19 (d, 1H; N=CH, *J*=6.3Hz); 7.80 (m, 6H; PPh₃); 7.42 (m, 14H; 9H PPh₃ + 5H aromatics); 7.25 (d, 1H; H⁶ Phbz, *J*=7.4Hz); 6.92(m, 1H; H⁵ Phbz); 6.58 (m, 1H; H⁴ Phbz); 6.48 (m, 1H; H³ Phbz); 1.71 (m, 3H CH₃COO). ³¹P NMR (300MHz, CDCl₃): 41.80.

3.2 Representative procedure for the synthesis of [Pd(Phbz)(2,4,6-F₃C₆H₂)(PPh₃)] (2)

To a stirred white suspension in tetrahydrofuran (6 mL) of [Pd(Phbz)(AcO)(PPh₃)] (0.07 g; 0.115 mmol) was added excess of 2,4,6-trifluorophenylboronic acid (0.121 g; 0.691 mmol; 1:6 ratio) and 3 ml extra of tetrahydrofuran. A pale yellow solution was observed after 30 minutes stirring; It was then concentrated until *ca.* one fifth of the initial volume and slow addition of hexane caused the precipitation of a white solid, , that was filtered off, washed with hexane and air dried.

A pure sample of [Pd(phbz)(2,4,6-F₃C₆H₂)(PPh₃)] was also obtained when a 1:2 ratio was employed in this reaction, whilst 1:1 ratio yielded the new compound mixed with starting material [Pd(Phbz)(AcO)(PPh₃)] easily identified by ¹H and ³¹P-NMR spectroscopy.

The desired complex [Pd(phbz)(2,4,6-F₃C₆H₂)(PPh₃)] can also be prepared using the same procedure (1:6 ratio) and imidate analogues [Pd(Phbz)(succinimide)(PPh₃)] or [Pd(Phbz)(maleimide)(PPh₃)] as starting materials.

(2) [Pd(Phbz)(2,4,6-F₃C₆H₂)(PPh₃)] (0.055 g, 70%). Anal. Found: C, 65.4; H, 4.2; N, 2.2. Calc. for C₃₇H₂₇F₃NPPd: C, 65.3; H, 4.0; N, 2.1%. IR (cm⁻¹): ν (2,4,6-F₃C₆H₂) 1594s, 1405s, 1100s, 990s; ν (Phbz) 1545s, ν (PPh₃) 528, 515. ESI-MS (positive mode) m/z: 680 M⁺+1, 548 M⁺-2,4,6-F₃C₆H₂; 499 547 M⁺-Phbz. δ _H (300 MHz, CDCl₃): 8.10 (s, 1H; N=CH); 7.55 (m, 16H; 15H PPh₃ + 1H Phpz); 7.06 (m, 2H; Phbz); 6.78(m, 1H; Phbz); 6.69 (m, 3H; Phbz); 6.50 (d, 2H; *J*=7.5Hz, Phbz); 6.14 (dd, 2H, *J*=9.5 Hz, *J*=5.4 Hz C₆H₂F₃). δ _P (121.5 MHz, CDCl₃): 19.86. δ _F (282.3 MHz, CDCl₃): -84.50 (m,

2F), -120.30 (m, 1F). Spectroscopic characterization was completed by Accurate Mass LC/MS TOF, where the abundance of the experimental signals around the parent ion is consistent with the natural isotopic abundances as shown in Figure 1. As can be seen, small differences between calculated and experimental mass were found, with a relative error in mass of < 5 ppm.

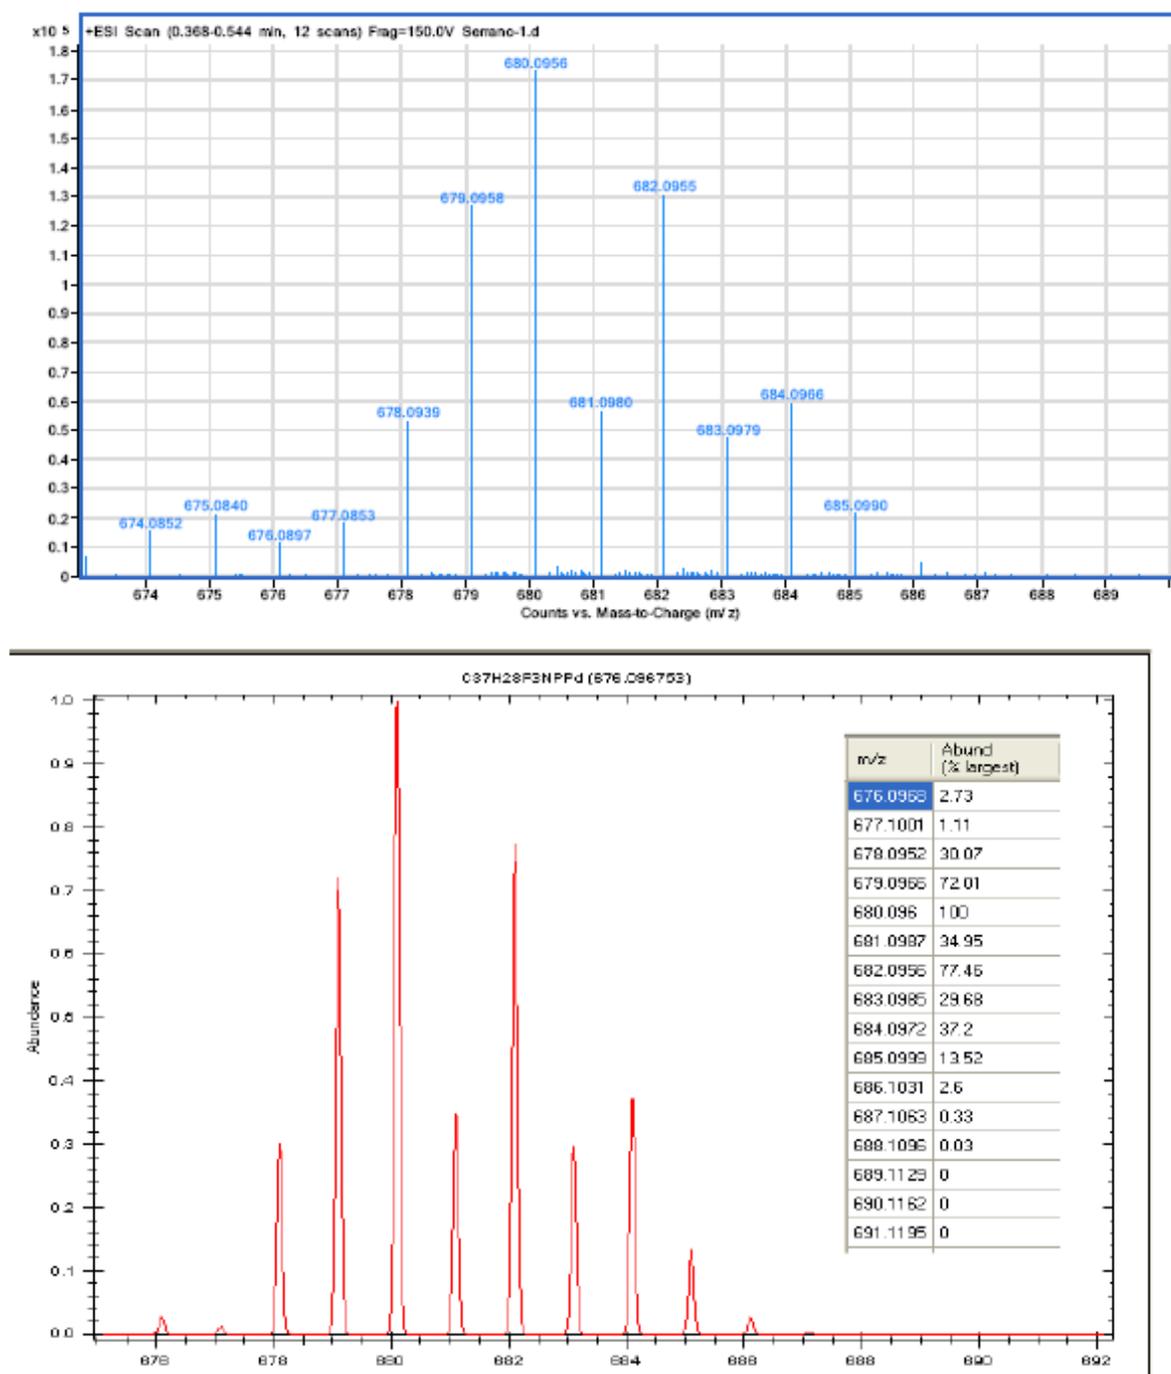

Figure 1. Comparison between experimental (up) and calculated (below) isotopic pattern for the peak at m/z: 680 corresponding to M^{+1} of (2).

Single crystals able to X-ray diffraction analysis were grown from slow diffusion of CH₂Cl₂/Hexane solution. The structure is displayed in Figure 2; bond lengths and angles are presented in Table 2. The structure around the palladium atom can be described as nearly planar, and its deviation from the planar coordination has been quantified by measures of improper torsion angles: $w_1 = 0.00$ and $w_2 = -2.88^\circ$, which means C(1)-N(1)-Pd(1)-C(14) defining a plane and P(1) slightly above that plane.⁴ We have developed methods for the conformational classification of rings.⁵ From this perspective the Pd(1)-C(1)-C(6)-C(7)-N(1) ring displays HC = 0.5140 and E = 0.4860 for $\sigma = 10$. Following the classification of Dance and Scudder for PPh₃ based on measures of torsion angles M-P-C_{ipso}-C, the conformation of PdP(phenyl)₃ group is described as a *no rotor* for this complex.⁶

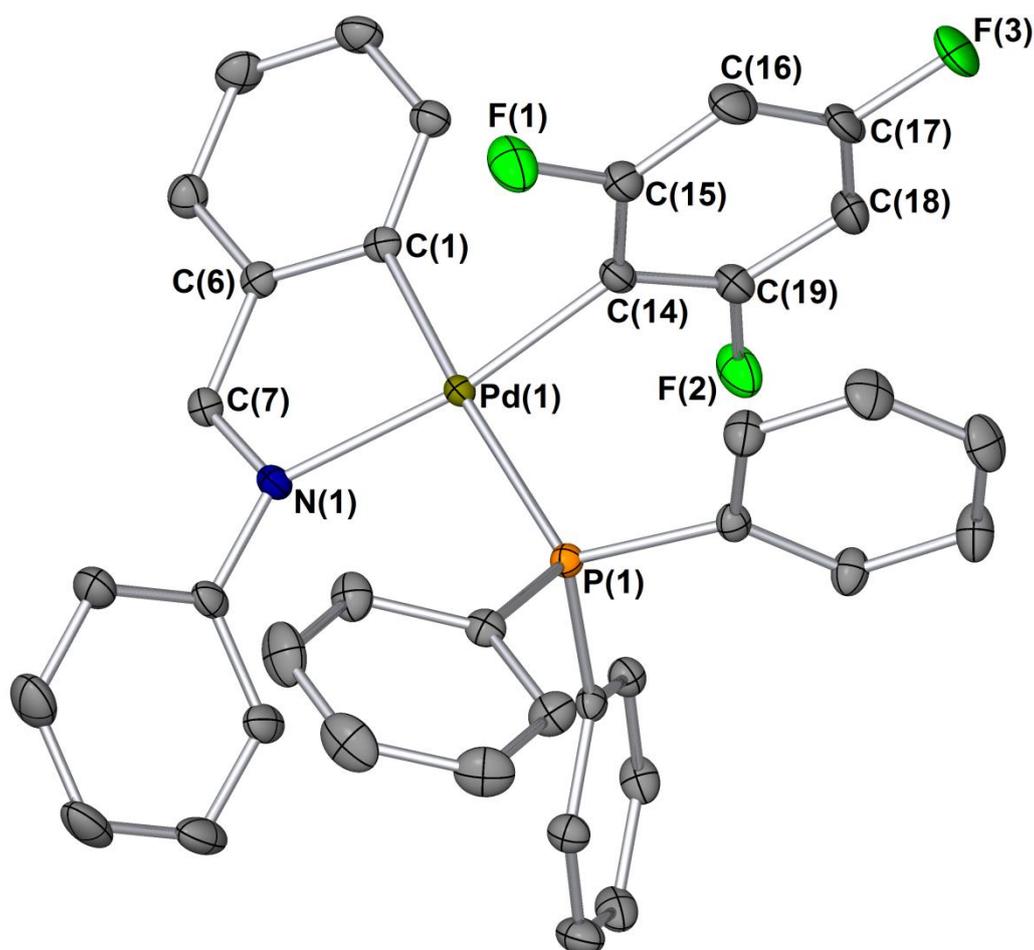

Figure 2. X-ray structure of [Pd(phbz)(2,4,6-F₃C₆H₂)(PPh₃)]

3.3 Representative procedure for the synthesis of [Pd(phazb)(2,4,6-F₃C₆H₂)(PPh₃)] (3)

To a stirred orange solution in tetrahydrofuran (6 mL) of [Pd(Phazb)(AcO)(PPh₃)] (0.07 g; 0.115 mmol) was added excess of 2,4,6-trifluorophenylboronic acid (0.121 g; 0.691 mmol; 1:6 ratio). The solution was allowed to stir for 30 minutes and then it was concentrated until *ca.* one fifth of the initial volume. Slow addition of hexane caused the precipitation of an orange solid that was filtered off, washed with hexane and air dried.

(3) [Pd(Phazb)(2,4,6-F₃C₆H₂)(PPh₃)] (0.053 g, 68%). Anal. Found: C, 63.7; H, 4.0; N, 4.2. Calc. for C₃₆H₂₆F₃N₂PPd: C, 63.5; H, 3.8; N, 4.1%. IR (cm⁻¹): ν (2,4,6-F₃C₆H₂) 1591s, 1402s, 1108s, 994s; ν (Phazb) 1573m, ν (PPh₃) 524, 512. ESI-MS (positive mode) m/z: 681 M⁺+1, 549 M⁺-2,4,6-F₃C₆H₂; 499 547 M⁺-Phbz. δ_{H} (300 MHz, CDCl₃): 8.19 (d, 1H; Phazb, *J*=6.3Hz); 7.50 (m, 16H; 15H PPh₃ + 1H Phazb); 6.98 (m, 3H; Phazb); 6.79 (m, 2H; Phazb); 6.66 (m, 1H; Phazb); 6.15 (m, 2H, C₆H₂F₃). δ_{P} (121.5 MHz, CDCl₃): 19.85. δ_{F} (282.3 MHz, CDCl₃): -84.52 (m, 2F), -119.53 (m, 1F).

Spectroscopic characterization was completed by Accurate Mass LC/MS TOF, where the abundance of the experimental signals around the parent ion is consistent with the natural isotopic abundances as shown in Figure 3. As can be seen, small differences between calculated and experimental mass were found, with a relative error in mass of < 5ppm.

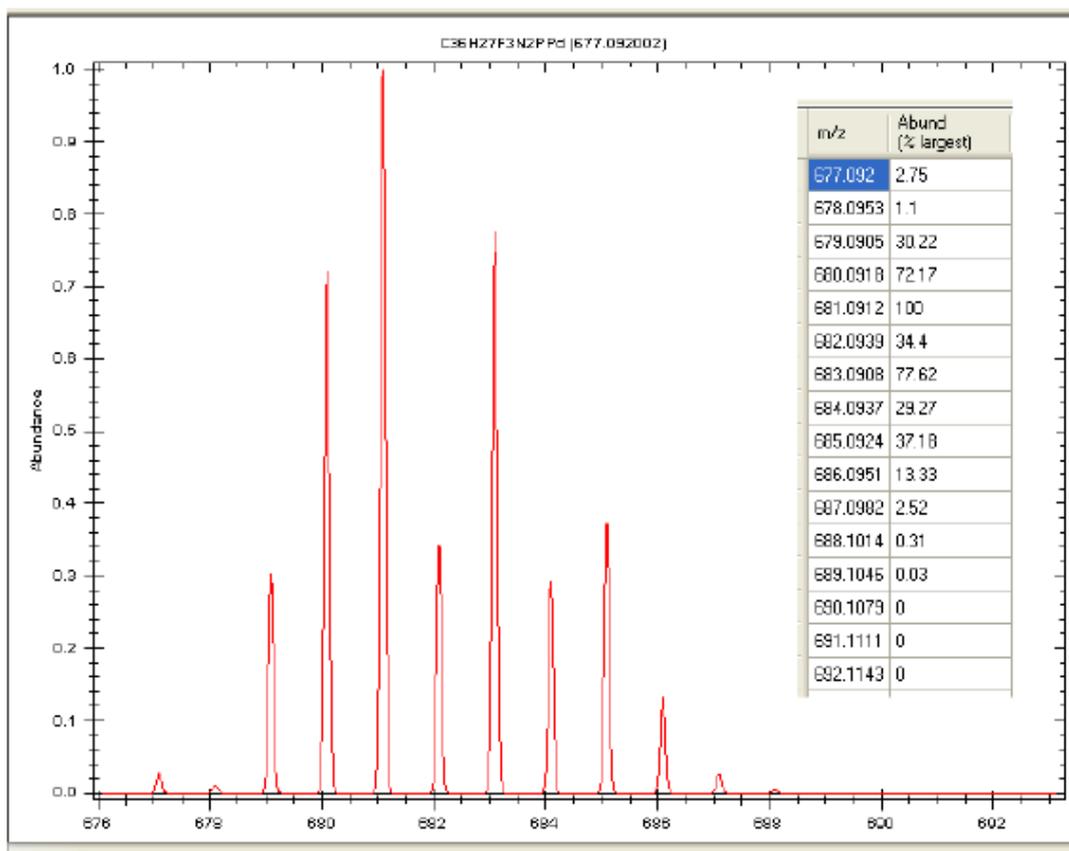

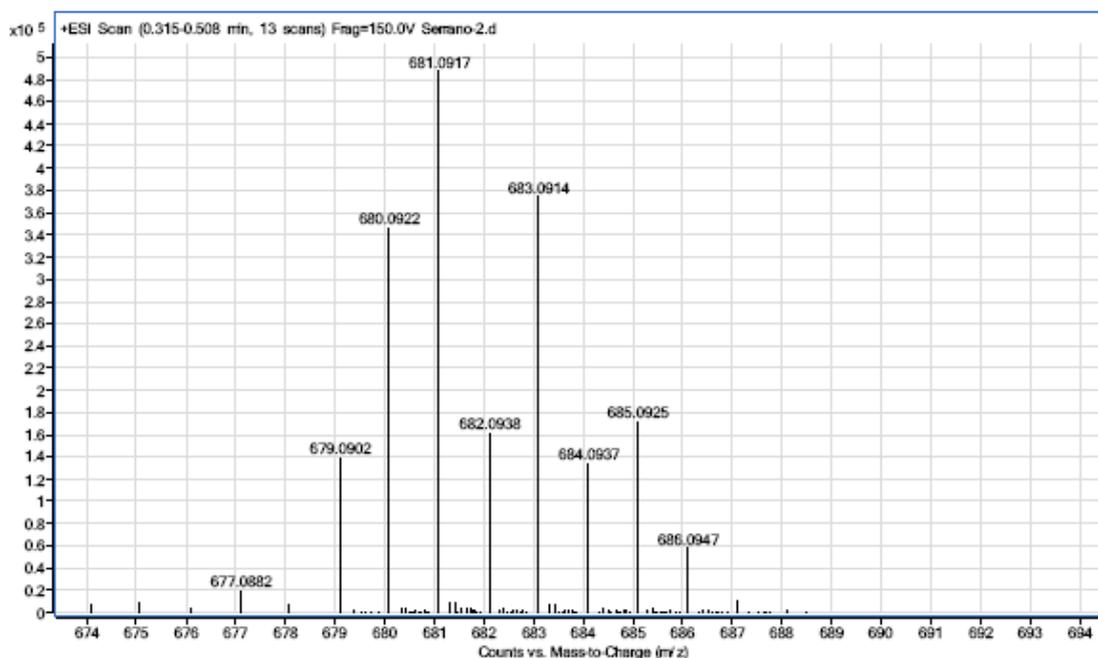

Figure 3. Comparison between experimental (up) and calculated (below) isotopic pattern for the peak at m/z: 681 corresponding to M^{+1} of (3).

Single crystals able to X-ray diffraction analysis were grown from slow diffusion of CH_2Cl_2 /Hexane solution. The structure is displayed in Figure 4; bond lengths and angles are presented in Table 2. The

coordination geometry around the palladium atom may be described as planar and their deviation from the planar coordination has been quantified by measures of improper torsion angles, with values of $w_1 = -6.56^\circ$ and $w_2 = -2.54^\circ$.⁴ These values correspond to a tetrahedral distortion from the ideal square-plane. We have developed methods for the conformational classification of rings.⁵ From this perspective the Pd(1)-C(1)-C(6)-N(2)-N(1) ring displays HC = 0.5151 and E = 0.4849 for $\sigma = 10$. Following the classification of Dance and Scudder for PPh₃ based on measures of torsion angles M-P-C_{ipso}-C, the conformation of PdP(phenyl)₃ group is described as *no rotor* for this complex.⁶

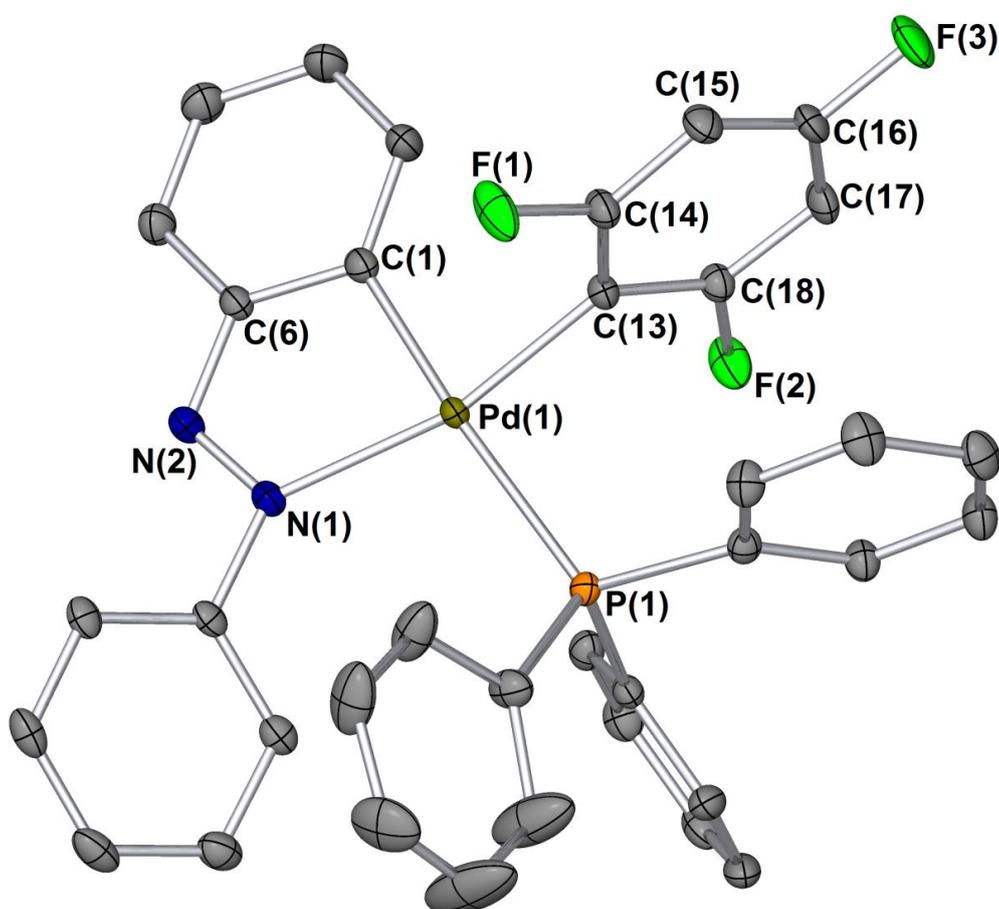

Figure 4. X-ray structure of [Pd(phazb)(2,4,6-F₃C₆H₂)(PPh₃)]

3.4 Representative data for [Pd₂(2,4,6-C₆F₃H₂)₂(PPh₃)₂(μ-OH)(μ-OAc)] (4)

From reactions of [Pd(phbz)(AcO)(PPh₃)] with 2,4,6-trifluorophenylboronic acid left for prolonged periods (*ca.* 16-24 h), other minor phosphorus signals were also observed in the ³¹P/¹⁹F NMR spectra of the crude reaction mixture. In one particular case, we observed the formation of a different set of crystals that turned out to be dimeric complex (4). Its NMR data are shown below. δ_H (300 MHz, CDCl₃): 7.80 (d, 12H; PPh₃, *J*=6.3Hz); 7.53 (m, 6H; PPh₃); 7.30 (m, 12H; PPh₃); 0.79 (s, 3H; CH₃COO); -1.52 (s, 1H, OH). δ_P (121.5 MHz, CDCl₃): 24.26. δ_F (282.3 MHz, CDCl₃): -87.30 (m, 2F), -119.26 (m, 1F).

Single crystals able to X-ray diffraction analysis were grown from slow diffusion of CH₂Cl₂/Hexane solution. The structure is displayed in Figure 5; bond lengths and angles are presented in Table 2. The coordination geometry around the Pd atoms may be described as planar and their deviation from the planar coordination has been quantified by measures of improper torsion angles, with values of *w*₁ = 1.28° and *w*₂ = -1.36° for Pd(1) and *w*₁ = 2.46° and *w*₂ = -2.84° for Pd(2). These values correspond respectively to a pyramidal square and tetrahedral distortion from the ideal square-plane.⁴ We have developed methods for the conformational classification of rings.⁵ From this perspective the Pd(1)-O(1)-Pd(2)-O(3)-C(25)-O(2) ring displays a *screw-boat* conformation distorted by 15° (SB = 0.9728; E = 0.0247; HC = 0.0025) for σ = 10. Following the classification of Dance and Scudder for PPh₃ based on measures of torsion angles M-P-C_{*ipso*}-C, the conformation of PdP(phenyl)₃ groups are described as a *good rotor* for this complex.⁶

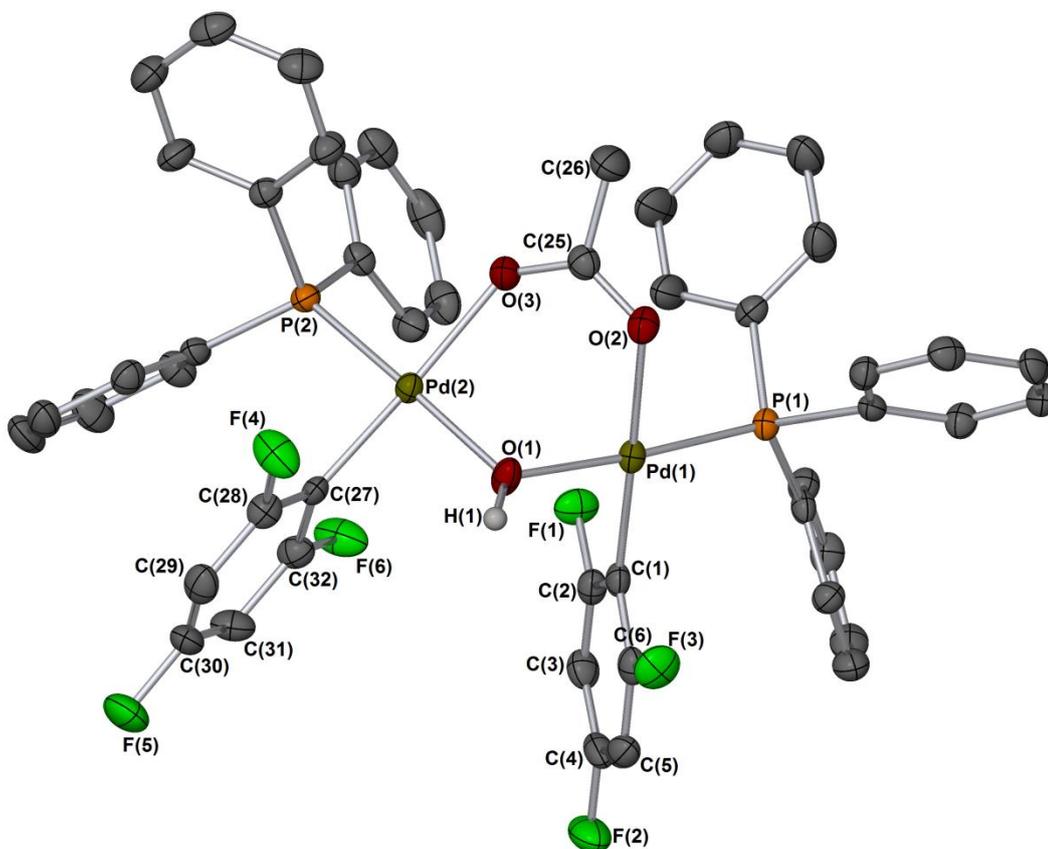

Figure 5. X-ray structure of (4) $[\text{Pd}_2(2,4,6\text{-C}_6\text{F}_3\text{H}_2)_2(\text{PPh}_3)_2(\mu\text{-OH})(\mu\text{-OAc})]$

3.5 Crystal structure of *trans*- $[\text{PdCl}(2,4,6\text{-F}_3\text{C}_6\text{H}_2)(\text{PPh}_3)]$ (5)

In three separate instances involving the crystallisation of $[\text{Pd}(\text{phbz})(2,4,6\text{-F}_3\text{C}_6\text{H}_2)(\text{PPh}_3)]$ or $[\text{Pd}(\text{phazb})(2,4,6\text{-F}_3\text{C}_6\text{H}_2)(\text{PPh}_3)]$ from CH_2Cl_2 , crystals of *trans*- $[\text{PdCl}(2,4,6\text{-F}_3\text{C}_6\text{H}_2)(\text{PPh}_3)]$ were formed, the structure of which was confirmed by single crystal X-ray diffraction (Figure 6). This is adequately explained by adventitious HCl promoting the decomposition of $[\text{Pd}(\text{phbz})(2,4,6\text{-F}_3\text{C}_6\text{H}_2)(\text{PPh}_3)]$.

Bond lengths and angles are presented in Table 2. The coordination geometry around the palladium atom may be described as planar and their deviation from the planar coordination has been quantified by measures of improper torsion angles, with values of $w_1 = 1.09^\circ$ and $w_2 = 0.21^\circ$. These values

correspond to a tetrahedral distortion from the ideal square-plane.⁴ Following the classification of Dance and Scudder for PPh₃ based on measures of torsion angles M-P-C_{ipso}-C, the conformation of PdP(phenyl)₃ groups are described as *no rotor* for P(1) and *good rotor* for P(2) in this complex.⁶
