# Chromo-fluorogenic BODIPY-complexes for selective detection of V-type nerve agent surrogates. 

Andrea Barba-Bon, Ana M. Costero, Salvador Gil, Félix Sancenón, Ramón Martínez-Máñez

## Experimental section

General remarks: $\mathrm{CH}_{3} \mathrm{CN}$ was distilled from $\mathrm{P}_{2} \mathrm{O}_{5}$ under Ar prior to use. $\mathrm{NaAuCl}_{4}$ was prepared by neutralization of an aqueous solution of $\mathrm{HAuCl}_{4}$ with $\mathrm{NaHCO}_{3}$. All the other solvents and starting materials were purchased from commercial sources where available, and were used without purification. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 300 MHz ), ${ }^{13} \mathrm{C}$ NMR spectra were determined in a Bruker AV 300 spectrometer. Chemical shifts are reported in parts per million (ppm), calibrated to the solvent peak set.

Synthesis of 1: Synthesis of (E)-4,4-difluoro-5-(4-((2-hydroxyethyl)(methyl)amino)styryl)-1,3,7-trimethyl-8-phenyl-4-bora-3a,4a-diaza-s-indacene has been reported previously. ${ }^{1}$

Synthesis of 1-Eu ${ }^{3+}$ : To a solution of $\mathbf{1}(243 \mathrm{mg} ; 0.5 \mathrm{mmol})$ in 30 mL of MeOH an aqueous solution of $\mathrm{Eu}\left(\mathrm{NO}_{3}\right)_{2} \cdot 5 \mathrm{H}_{2} \mathrm{O}(214 \mathrm{mg} ; 0.5 \mathrm{mmol})$ was added dropwise and the mixture was stirred for 3 h . at rt . The resulting bright pink reaction mixture was evaporated under reduced pressure. The solid was recrystallized from EtOH-water (1:1) to give $1-\mathrm{Eu}^{3+}(285 \mathrm{mg} ; 61 \%) .{ }^{1} \mathrm{H}-\mathrm{MNR}\left(300 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) \delta 7.64(\mathrm{dd}, \mathrm{J}=17.4,9.0 \mathrm{~Hz}, 4 \mathrm{H}), 7.43(\mathrm{~m}, 3 \mathrm{H})$, $7.23(\mathrm{~m}, 3 \mathrm{H}), 7.10(\mathrm{~d}, \mathrm{~J}=16.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.54(\mathrm{~s}, 1 \mathrm{H}), 5.99(\mathrm{~s}, 1 \mathrm{H}), 3.86(\mathrm{~s}, 2 \mathrm{H}), 3.57(\mathrm{~s}, 2 \mathrm{H}), 3.20(\mathrm{~s}, 3 \mathrm{H}), 2.54(\mathrm{~s}, 3 \mathrm{H}), 1.34$ $(\mathrm{d}, \mathrm{J}=8.6 \mathrm{~Hz}, 6 \mathrm{H})$. UV/vis $\left(\mathrm{CH}_{3} \mathrm{CN}\right) \lambda_{\max }=553.0 ; \lambda_{\mathrm{em}}=572.8 \mathrm{~nm}$.

Synthesis of 1- $\mathrm{Au}^{3+}$ : To a solution of $\mathrm{NaAuCl}_{4}(150 \mathrm{mg} ; 0.40 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{~mL}), \mathrm{NaHCO}_{3}(35 \mathrm{mg} ; 0.40 \mathrm{mmol})$ and $\mathrm{KPF}_{6}(150 \mathrm{mg} ; 0.82 \mathrm{mmol})$ was added. To this solution a solution of $\mathbf{1}(200 \mathrm{mg} ; 0.41 \mathrm{mmol})$ in $\mathrm{MeOH}(5 \mathrm{~mL})$ was added dropwise. The product precipitated as a pink solid, which was separated by filtration and recrystallized from EtOH-water (1:1) to give 1-Au ${ }^{3+}(170 \mathrm{mg} ; 47 \%) .{ }^{1} \mathrm{H}-\mathrm{MNR}\left(300 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) \delta 7.71(\mathrm{dd}, \mathrm{J}=17.4,9.0 \mathrm{~Hz}, 4 \mathrm{H})$, $7.49(\mathrm{~m}, 3 \mathrm{H}), 7.30(\mathrm{~m}, 3 \mathrm{H}), 7.17(\mathrm{~d}, \mathrm{~J}=16.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.61(\mathrm{~s}, 1 \mathrm{H}), 6.06(\mathrm{~s}, 1 \mathrm{H}), 3.93(\mathrm{~s}, 2 \mathrm{H}), 3.64(\mathrm{~s}, 2 \mathrm{H}), 3.27(\mathrm{~s}, 3 \mathrm{H})$, $2.58(\mathrm{~s}, 3 \mathrm{H}), 1.38(\mathrm{~m}, 6 \mathrm{H})$. UV/vis $\left(\mathrm{CH}_{3} \mathrm{CN}\right) \lambda_{\text {max }}=552.5 ; \lambda_{\mathrm{em}}=573.2 \mathrm{~nm}$.

Spectroscopic studies: Acetonitrile was purchased at spectroscopic grade from Aldrich Chemicals Co., used as received, and was found to be free of fluorescent impurities. Absorption and fluorescence spectra were recorded using a Shimadzu UV-2600 spectrophotometer and a Varian Cary Eclipse spectrofluorimeter, respectively. Fluorescence quantum yields were measured at room temperature in the $\mathrm{N}_{2}$-purgued solution using rhodamine $\mathrm{B}\left(\Phi_{\mathrm{EtOH}}=0.49\right)^{2}$ at 525 nm as standard. The fluorescence quantum yields were calculated from Eq. (1). ${ }^{3}$ Here, F denotes the integral of the corrected fluorescence spectrum, A is the absorbance at the excitation wavelength, and n is the refractive index of the medium.

$$
\begin{equation*}
\phi_{\text {exp }}=\phi_{r e f} \frac{\boldsymbol{F}\left\{1-\exp \left(-\boldsymbol{A}_{\text {ref }} \ln 10\right)\right\} n^{2}}{\boldsymbol{F}_{\text {ref }}\{1-\boldsymbol{\operatorname { e x p }}(-\boldsymbol{A} \ln 10)\} \boldsymbol{n}_{\text {ref }}^{2}} \tag{1}
\end{equation*}
$$

Limits of detection measurements: Increasing amounts of demeton-S dissolved in acetonitrile were progressively added to 3.5 mL solutions of $\mathbf{1}-\mathrm{Eu}^{3+}$ and $\mathbf{1}-\mathrm{Au}^{3+}\left(1.0 \times 10^{-5} \mathrm{M}\right)$. The UV-visible and fluorescence spectra were recorded in $1-\mathrm{cm}$ path length cells at $25^{\circ} \mathrm{C}$. Representation of $\Delta$ of absorbance or fluorescence at the appropriate wavelength vs. concentration of simulant allowed the limit of detection to be calculated by using the equation (2) where $K=3 ; \mathrm{Sb}_{1}$ is the standard deviation of the blank solution and S is the slope of the calibration curve. ${ }^{4}$

$$
\begin{equation*}
L O D=K \frac{S b_{1}}{S} \tag{2}
\end{equation*}
$$

Figure 1. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra of $\mathbf{1}$ (in $\mathrm{CDCl}_{3}$ ) before and after complexation with $\mathrm{Eu}^{3+}$.

Figure 2. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra of $\mathbf{1}\left(\right.$ in $\mathrm{CDCl}_{3}$ ) before and after complexation with $\mathrm{Au}^{3+}$.

Structural proposal 1-Eu ${ }^{3+}$ and $1-\mathrm{Au}^{3+}:{ }^{1} \mathrm{H}$ NMR spectra of ligand $\mathbf{1}$ free and the presence of $\mathrm{Eu}^{3+}$ and $\mathrm{Au}^{3+}$ were recorded in $\mathrm{CDCl}_{3}$. The most important modifications of the signals of 1 after complexation with $\mathrm{Au}^{3+}$ were observed in the phenyl moiety ( 7.48 and 6.74 ppm ) which underwent a significant downfield shift upon the addition of $\mathrm{Eu}^{3+}$ and $\mathrm{Au}^{3}$ ( 0.23 and 0.75 ppm respectively). The change is especially important in the ortho-protons to the amino group. On the other hand the methylene groups show a downfield shift around 0.1 ppm . A displacement of downfield of 0.20 ppm in the methyl on the amino group is observed. Finally, there were no changes in the protons of the pyrrole units. These data strongly suggest the direct involvement of the amino group in the $\mathrm{M}^{3+}$ coordination. Similar behavior was observed for $\mathrm{Eu}^{3+}$.

Figure 3. Absorption (left) and fluorescence (right) spectra $\left(\lambda_{\mathrm{ex}}=530 \mathrm{~nm}\right)$ recorded for $1,1-\mathrm{Eu}^{3+}$ and $1-\mathrm{Au}^{3+}\left(1.0 \times 10^{-5} \mathrm{M}\right.$ in $\mathrm{CH}_{3} \mathrm{CN}$ ).

Figure 4. Absorption (left) and fluorescence (right) titration $\left(\lambda_{\mathrm{ex}}=530 \mathrm{~nm}\right)$ of $\mathbf{1}-\mathrm{Au}^{3+}\left(1.0 \times 10^{-5} \mathrm{M}\right.$ in $\left.\mathrm{CH}_{3} \mathrm{CN}\right)$ upon addition of incremental amounts of demeton-S $\left(1.0 \times 10^{-4} \mathrm{M}\right.$ in $\left.\mathrm{CH}_{3} \mathrm{CN}\right)$.

Figure 5. Absorption (left) and fluorescence (right) titration ( $\lambda_{\mathrm{ex}}=530 \mathrm{~nm}$ ) of $\mathbf{1}\left(1.0 \times 10^{-5} \mathrm{M}\right.$ in $\left.\mathrm{CH}_{3} \mathrm{CN}\right)$ upon addition of incremental amounts of $\mathrm{Eu}^{3+}$ used for association constants calculations. The inset shows the corresponding Job plot's.

Figure 6. Absorption (left) and fluorescence (right) titration ( $\lambda_{\mathrm{ex}}=530 \mathrm{~nm}$ ) of $\mathbf{1}\left(1.0 \times 10^{-5} \mathrm{M}\right.$ in $\left.\mathrm{CH}_{3} \mathrm{CN}\right)$ upon addition of incremental amounts of $\mathrm{Au}^{3+}$, used for association constants calculations. The inset shows the corresponding Job plot's.

Figure 7. $\mathrm{Abs} / \mathrm{Abs}_{0}$ of $\mathbf{1}-\mathrm{Eu}^{3+}$ and $\mathbf{1}-\mathrm{Au}^{3+}\left(1.0 \times 10^{-5} \mathrm{M}\right)$ versus increasing amounts of Demeton-S at room temperature .

Figure 8. Fluorescence Intensity of $1-\mathrm{Eu}^{3+}$ and $1-\mathrm{Au}^{3+}\left(1.0 \times 10^{-5} \mathrm{M}\right)$ versus increasing amounts of Demeton-S at room temperature.

Figure 9: Absorbance (measured at 600.5 nm ) of a) $1-\mathrm{Eu}^{3+}$ and b) $1-\mathrm{Au}^{3+}$ in the presence of Demeton- S and G-type derivatives. The black bars represent the addition of G-type derivatives $(200 \mathrm{ppm})$ to the solution of $1-\mathrm{M}^{3+}$. The grey bars represent the subsequent addition of Demeton-S ( 100 ppm ) to the above solution. 1-5 represent $1-\mathrm{M}^{3+}$, DCNP, DFP, DMMP and DCNP + DFP + DMMP, respectively.

Figure 10: Visible spectra of $1-\mathrm{Eu}^{3+}$ and $1-\mathrm{Au}^{3+}\left(10^{-5} \mathrm{M}\right)$ in aqueous mixtures a) $\mathrm{H}_{2} \mathrm{O}: \mathrm{CH}_{3} \mathrm{CN}(10: 90 \mathrm{v} / \mathrm{v})$, b) $\mathrm{H}_{2} \mathrm{O}: \mathrm{CH}_{3} \mathrm{CN}(50: 50$ $\mathrm{v} / \mathrm{v})$ alone and in the presence of Demeton-S (100 ppm).
