## General Information

All chemicals were purchased as reagent grade and used without further purification. Solvents for purification (extraction and chromatography) were purchased as technical grade and distilled on the rotary evaporator prior to use. For column chromatography $\mathrm{SiO}_{2}-60$ (230400 mesh ASTM; Fluka) was used as stationary phase. Analytical thin layer chromatography (TLC) was performed on glass plates pre-coated with $\mathrm{SiO}_{2}-60 \mathrm{~F}_{254}$ (Merck) and visualized with a UV-lamp ( 254 nm ) and $\mathrm{KMnO}_{4}$ solution. Concentration in vacuo was performed at $\sim 10$ mbar and $40{ }^{\circ} \mathrm{C}$, drying at $\sim 10^{-2}$ mbar and rt. NMR spectra were measured by the NMR service of the Organisch-Chemisches Institut, Westfälische Wilhelms-Universität Münster on a Bruker AV300 or an Agilent DD2 600 spectrometer at $\mathrm{rt} .{ }^{1} \mathrm{H}$ NMR spectra are reported as follows: chemical shift $\delta$ in ppm (multiplicity, number of protons, coupling constant $J$ in Hz , assignment of proton). The deuterated solvent residual peak was used as internal reference: $\mathrm{CHCl}_{3}\left(\delta_{\mathrm{H}} 7.26\right)$ and $\mathrm{CD}_{2} \mathrm{HCN}\left(\delta_{\mathrm{H}} 1.94\right) .{ }^{13} \mathrm{C}$ NMR spectra are reported as follows: chemical shift $\delta$ in ppm (multiplicity if different from s due to heteronuclear couplings to fluorine, number of carbons if different from 1 , coupling constant ${ }^{\mathrm{x}} J_{\mathrm{CF}}$ in Hz , assignment of carbon). The solvent peak was used as internal reference: $C \mathrm{DCl}_{3}\left(\delta_{\mathrm{C}} 77.16\right)$ and $C \mathrm{D}_{3} \mathrm{CN}\left(\delta_{\mathrm{C}} 1.32\right)$. ${ }^{19}$ F NMR spectra are reported as follows: chemical shift $\delta$ in ppm (multiplicity, number of fluorines, coupling constant ${ }^{\mathrm{x}} J_{\mathrm{YF}}$ in Hz , assignment of fluorine). The resonance multiplicity is abbreviated as: s (singlet), d (doublet), t (triplet), q (quadruplet), m (multiplet) and b (broad). Assignments of unknown compounds are based on DEFT, COSY (HH and FF), HMBC, HSQC and NOESY spectra. Melting points were measured on a Büchi B-545 melting-point apparatus in open capillaries and are uncorrected. IR spectra were recorded on a Perkin-Elmer 100 FT-IR spectrometer, selected adsorption bands are reported in wavenumbers $\left(\mathrm{cm}^{-1}\right)$ and intensities are reported as: w (weak), m (medium), s (strong) and br (broad). Optical rotations were measured on a JASCO P-2000 polarimeter or a Perkin-Elmer 341 polarimeter. HPLC spectra were recorded on an Agilent 1100 series (DAD, Agilent technologies 1200 series) using a Chiralcel OJ-H ( $5 \mu \mathrm{~m}, 250 \cdot 4.6 \mathrm{~mm}$ ) and $n$-hexane/iso-propanol as eluent. Highresolution mass spectra (HR ESI) were measured by the MS service of the OrganischChemisches Institut, Westfälische Wilhelms-Universität Münster.

## L-Phenylalanine methyl amide $13{ }^{1}$

To a suspension of $L$-phenylalanine ( $6.98 \mathrm{~g}, 42.3 \mathrm{mmol}, 1.0$ equiv.) in MeOH ( $17.1 \mathrm{~mL}, 423 \mathrm{mmol}, 10$ equiv.) was added thionyl chloride ( 3.70 mL , $50.7 \mathrm{mmol}, 1.2$ equiv.) over 15 min at $0^{\circ} \mathrm{C}$ and the resulting solution was allowed to come to RT before it was heated to reflux for 22 h . The solution was allowed to come to RT and evaporated in vacuo to give the $L$-phenylalanine methyl ester hydrochloride as a white solid. To the ester was added $\mathrm{MeNH}_{2}$ ( 8 N in $\mathrm{EtOH}, 21.0 \mathrm{~mL}, 169 \mathrm{mmol}, 4.0$ equiv.) at RT and the solution stirred for 23 h . The reaction was concentrated in vacuo and a saturated aqueous solution of $\mathrm{NaHCO}_{3}(45 \mathrm{~mL})$ was
added. The aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 55 \mathrm{~mL})$. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtrated and concentrated in vacuo to give the amide $\mathbf{1 3}$ as a yellowish solid ( $6.44 \mathrm{~g}, 86 \%$ ).

After an additional 30 min , 1 -methyl- 1 H -pyrrole (11) $(15 \mu \mathrm{~L}, \quad 0.17 \mathrm{mmol}$, 1.0 equiv.) was added and the yellow solution stirred for the given time, after which complete conversion of the starting material was observed by TLC. EtOH ( 0.5 mL ) and $\mathrm{NaBH}_{4}$ ( $19.0 \mathrm{mg}, 0.50 \mathrm{mmol}, 3.0$ equiv.) were added (and the mixture warmed to RT). The reduction was quenched with aqueous saturated $\mathrm{NaHCO}_{3}$ after 30 min and extracted three times with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic layers were dried over $\mathrm{MgSO}_{4}$ and evaporated in vacuo. The crude product 31 was purified by column chromatography (CH/EtOAc 4:1). The enantioselectivities were determined by chiral HPLC on a Chiracel OJ-H column, using $n$-hexane $/ i$ - $\mathrm{PrOH} 85: 15$ as eluent $(1.0 \mathrm{~mL} / \mathrm{min})$. ## DFT Calculations

All calculations were performed with the TURBOMOLE 6.5 program. ${ }^{18}$ The structures were optimized without any geometry constraints using the TPSS functional ${ }^{19}$, which has been successfully applied to supramolecular thermochemistry, ${ }^{23}$ and an atom-pairwise dispersion correction (D3). ${ }^{20,}{ }^{21} \mathrm{~A}$ flexible triple zeta basis set (def2-TZVP) ${ }^{22}$ was used in all calculations. For the calculation of zero point vibrational energies and free enthalpy contributions, a rotor approximation was applied for vibrational modes with wave numbers below $100 \mathrm{~cm}^{-1} .{ }^{23}$ Solution energies were obtained with the COSMO model ${ }^{24}$ as implemented in Turbomole with $\varepsilon=37.5$.

Structures of conformers of iminium cations 1 and 2. The Ar-C-C-N ${ }^{+}$torsional angle is printed with each conformer.

The values of $Q_{z z}$ for the aromatic substituents reported in the manuscript were obtained by orienting the molecule such that the center of the methyl-substituted ring was located at the origin of the coordinate system. The component of the quadrupole moment tensor perpendicular to the aromatic plane $\left(q_{z z}\right)$ was then used to obtain the traceless quadrupole moment $Q_{z z}=q_{z z}-(1 / 3 \operatorname{tr}(\mathbf{q}))$.
