

Electronic Supplementary Information

Single-crystal microtubes of a novel apatite-type compound, $(\text{Na}_{2.5}\text{Bi}_{2.5})(\text{PO}_4)_3(\text{F},\text{OH})$, with well-faceted hexagonal cross sections

ESI Figure 1 Optical micrograph of the $(\text{Na}_{2.5}\text{Bi}_{2.5})(\text{PO}_4)_3(\text{F},\text{OH})$ (**NBPF**) microtubes under the microscope with polarized light. Optical continuity and extinction every 90° of rotation indicate that they are single crystals.

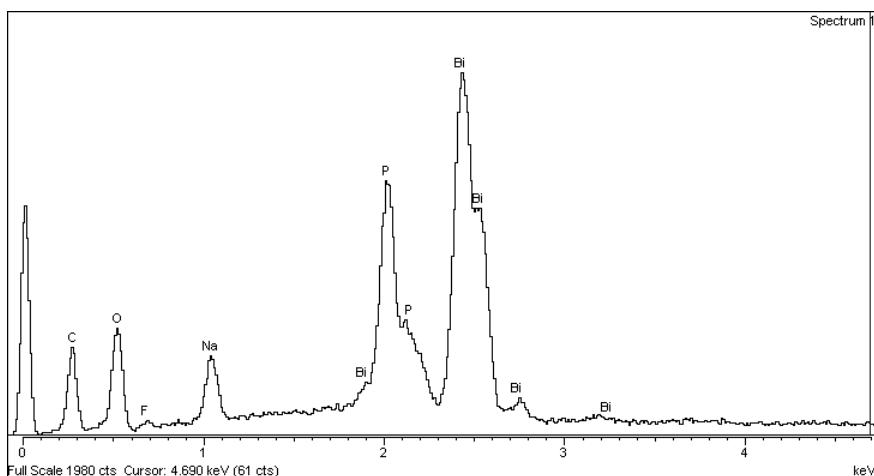

ESI Figure 2 TG-DTA curve of NBPF (heating rate $10\text{ }^{\circ}\text{C min}^{-1}$; atmosphere: argon). 1.0 % weight loss associated with the endothermic peak at $544\text{ }^{\circ}\text{C}$ in the DTA curve is in agreement with the calculated weight loss of one H_2O per $(\text{Na}_{2.5}\text{Bi}_{2.5})(\text{PO}_4)_3(\text{F},\text{OH})$ unit. The exothermic peak at $889\text{ }^{\circ}\text{C}$ accounts for a phase transition.

ESI Figure 3 PXRD patterns of the $(\text{Na}_{2.5}\text{Bi}_{2.5})(\text{PO}_4)_3(\text{F},\text{OH})$ microtubes (**NBPF**)
(a) non-annealed sample, (b) after thermal treatment at $650\text{ }^{\circ}\text{C}$.

ESI Figure 4 SEM images of $(\text{Na}_{2.5}\text{Bi}_{2.5})(\text{PO}_4)_3(\text{OH})$ (a, b, c) microrods without addition of any fluoride as reactants, and NBPF submicrorods (d), synthesized at the pH range of 6.5-7.0 at 180 °C for 48h: (a) needles; the reactants including Bi_2O_3 , $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$ and $\text{NaH}_2\text{PO}_4 \cdot 2\text{H}_2\text{O}$ with a reaction concentration (Bi^{3+} for example) about $0.05 \text{ mol} \cdot \text{L}^{-1}$ (b) microrods; the reactants including Bi_2O_3 and $\text{NaH}_2\text{PO}_4 \cdot 2\text{H}_2\text{O}$ with a reaction concentration (Bi^{3+} for example) about $0.05 \text{ mol} \cdot \text{L}^{-1}$ (c) microrods; the reactants including Bi_2O_3 , $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$, $\text{NaH}_2\text{PO}_4 \cdot 2\text{H}_2\text{O}$ and polyacrylamide, with a reaction concentration (Bi^{3+} for example) about $0.05 \text{ mol} \cdot \text{L}^{-1}$ (d) submicrorods; the reactants including Bi_2O_3 , $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$, $\text{NaH}_2\text{PO}_4 \cdot 2\text{H}_2\text{O}$ and NaBF_4 with a reaction concentration (Bi^{3+} for example) about $0.20 \text{ mol} \cdot \text{L}^{-1}$

ESI Figure 5 EDS spectrum from the Figure 3c microrod carried out at the cross section of hexagonal morphology shows the characteristic peaks of Na, Bi, P, O and F.
