

Structure and magnetism of a verdazyl radical clathrate hydrate. Strong intermolecular magnetic interactions derived from π -stacking within ice-like channels

Joe B. Gilroy,^a Martin T. Lemaire,^{a,b} Brian O. Patrick,^c and Robin G. Hicks^{a*}

Figure S1. Temperature dependence of the magnetic susceptibility of **3** (Independent sample). Data (\circ), fit (red line). Fitting ($g = 2.00$ fixed) yields $\rho = 0.88$, $J = -306 \text{ cm}^{-1} \pm 14 \text{ cm}^{-1}$, $R = 0.05$.
