I. Synthesis

Cupric oxide (CuO) samples were synthesized as follows: 0.5 mmol of copper (II) chloride dihydrate (CuCl₂.2H₂O, 99.9% Aldrich, USA) were added to 100 mL deionized water, and this solution was stirred for 10 minutes. Then, 5 mL of ammonium hydroxide (NH₄OH, 30%) was dripped into the copper (II) (Cu²⁺) solution under stirring for 15min. The light blue solution developed an intense blue color in the tetramminecuprate (II) ([Cu(NH₃)₄]²⁺). The derived solution was transferred to a microwave-hydrothermal system (MHS) (see Figure S1) (2.45 GHz/800 W) with a polytetrafluoroethylene vessel 120 mL capacity autoclave and kept at 100 °C for 30 seconds and for 15min under autogenous pressure. The resulting CuO black precipitates were collected and washed with deionized water several times and then dried at 60 °C in air.

II. Experimental Setup

In a typical design appeared in a Brazilian patent (2008-PI0801233-4), one hole was drilled into the wall of a domestic oven (2.45 GHz/800 W) for a polytetrafluoroethylene (PTFE) vessel in the oven top. The magnetron was monitored to a very efficient proportional-integral-derivative (PID) external controller. Intuitive software enables the user to control everything from process conditions (temperature, time and heating rate). The user simply defines the desired temperature-time profile, and the MHS will automatically carry out the programmed cycle.

III. Characterizations details

The samples were characterized by X-ray powder diffraction (XRD) on a Rigaku DMax 2500PC, 40kV, 150mA, using Cu $K\alpha$ ($\alpha = 1.5406$ Å). The 2 θ range used was from 25 to 75° in steps of 0.02° with a count time of 1 s. The field emission scanning electron microscopy (FESEM) images were performed on a microscope (Zeiss SupraTM 35) operating at 15 kV. The structural formation of CuO structures was measured by select–area diffraction (SAD) and transmission electron microscopy (TEM) and high resolution (HRTEM) on a Jeol JEM-3010 microscope at 300 kV. FTIR transmittance spectra were recorded by using a Bruker Equinox 55 spectrometer at 400–4,000 cm⁻¹ frequency range. Solid samples were prepared using 1% by weight in potassium bromide (KBr) pellet at room temperature. The RS were obtained using a micro-Raman Renishaw spectrograph model inVia equipped with a Leica microscope (50X objective with ~1µm² spatial resolution) and CCD detector. The scan ranges of 100 to 1400 cm⁻¹, using the 633nm wavelength of a He–Ne laser.

VI. Chemical equations

The arrangement of CuO crystals during an aqueous solution reaction is an equilibria of complex ions in solution. At the first stage, the dissociation for CuCl₂.2H₂O shown in equation (1) occurs. Then Cu²⁺ ions form the hexaaqua ions $[Cu(H_2O)_6]^{2+}$, according to equation (2). The acid equilibrium step is given generically as equation (3). Moreover, ammonia is a stronger ligand than water, and the $[Cu(NH_3)_4]^{2+}$ complex is readily formed in solution, according to equation (4). However, the base equilibrium also occurs in an ammonia solution, as seen in equation (5). The copper (II) hydroxide (Cu(OH)₂) is not formed before any ammonia solution is added because the hydroxide concentration is insufficient to remove NH₃ groups from the $[Cu(NH_3)_4]^{2+}$ complex. With the elimination of NH₃, the solution is heated by microwave radiation and the increase of hydroxyl ions in solution produces Cu(OH)₂, see equation (6). Finally, the dehydration of Cu(OH)₂ yields CuO primary crystals, according to equation (7). Thus, the crystallization appears to proceed through the aggregation of these CuO particles.

$CuCl_2.2H_2O(s) \rightarrow Cu^{2+}(aq) + 2C\Gamma(aq) + 2H_2O(l)$	(1)
$\operatorname{Cu}^{2+}(\operatorname{aq}) + 6\operatorname{H}_2\operatorname{O}(\operatorname{l}) \rightleftharpoons [\operatorname{Cu}(\operatorname{H}_2\operatorname{O})_6]^{2+}(\operatorname{aq})$	(2)
$[Cu(H_2O)_6]^{2+}(aq) + H_2O(l) \rightleftharpoons [Cu(H_2O)_5(OH)]^+(aq) + H_3O^+(aq)$	(3)
$[Cu(H_2O)_6]^{2+}(aq) + 4NH_3(aq) \rightleftharpoons [Cu(NH_3)_4]^{2+}(aq) + 6H_2O(l)$	(4)
$NH_3(aq) + H_2O(l) \rightleftharpoons NH_4^+(aq) + OH^-(aq)$	(5)
$[\operatorname{Cu}(\operatorname{NH}_3)_4]^{2+}(\operatorname{aq}) + 2\operatorname{OH}^-(\operatorname{aq}) \to \operatorname{Cu}(\operatorname{OH})_2(\operatorname{s}) + 4\operatorname{NH}_3(\operatorname{aq})$	(6)
$Cu(OH)_2(s) \rightarrow CuO(s) + H_2O(l)$	(7)
