Fig. S4 Solid-state emission spectra of $\mathbf{2}^{\prime}$ in different atmospheres with different relative humidity recorded at $1,3,5,9,15,24 \mathrm{~h}$. The emission bands arise from the ${ }^{5} \mathrm{D}_{0} \rightarrow{ }^{7} \mathrm{~F}_{\mathrm{J}}(J=1,2,3,4)$ transitions of $\mathrm{En}^{3+}$. The corresponding emission bands are 589, 612, 653 and 699 nm .

## Experimental Section

Materials and Methods. All the reagents (Acros) were used as obtained without further purification. Infrared (IR) samples were prepared as KBr pellets, and spectra were obtained in the $400-4000 \mathrm{~cm}^{-1}$ range using a Perkin-Elmer 1600 FTIR spectrometer. Elemental analyses were performed on a Perkin-Elmer Model 2400 analyzer. ${ }^{1} \mathrm{H}$ NMR data were collected using an AM-300 spectrometer. Chemical shifts are reported in $\delta$ relative to TMS. All fluorescence measurements were carried out on a Cary Eclipse Spectrofluorimeter (Varian, Australia) equipped with a xenon lamp and quartz carrier at room temperature. Thermogravimetric analyses were carried out using a TA Instrument SDT 2960 simultaneous DTA-TGA under flowing nitrogen at a heating rate of $10^{\circ} \mathrm{C} / \mathrm{min}$. XRD pattern were obtained on a D8 ADVANCE X-ray powder diffractometer (XRD) with CuKa radiation ( $\lambda=1.5405 \AA$ ). Humidity-controlled solutions of $96 \% \mathrm{H}_{2} \mathrm{SO}_{4}, 54 \% \mathrm{H}_{2} \mathrm{SO}_{4}, 44 \% \mathrm{H}_{2} \mathrm{SO}_{4}$, saturated NaCl , saturated KCl were put in closed glass chambers of 1 L , which respectively provide different constant RH: about $5 \%, 30 \%, 48 \%, 75.8 \%$, and $85 \%$ after 24 h . The solid-state emissions in different RH atmospheres were recorded after
humidity sensors $\mathbf{1 '}^{\prime}$ and $\mathbf{2 '}^{\prime}$ were placed in the chamber with different RH at $1,3,5,9,15,24 \mathrm{~h}$, respectively.

Synthesis of L. 2-(4-pyridyl benzimidazole) ( $2.0 \mathrm{~g}, 10.26 \mathrm{~mol}$ ) was added to $\mathrm{H}_{2} \mathrm{SO}_{4}(98 \%, 23.1 \mathrm{~g})$, the mixture was heated to $100^{\circ} \mathrm{C}$, and then $\mathrm{H}_{2} \mathrm{O}_{2}(30 \%, 16.0 \mathrm{~g})$ was slowly added to the system. After the solution was heated at $140-150^{\circ} \mathrm{C}$ for 1 h , the system was cooled down to $40^{\circ} \mathrm{C}$, water ( 200 mL ) was added, and L was obtained as yellow crystalline solids. Single-crystal analysis. For 1-2, X-ray intensity data were measured on a Bruker SMART APEX CCD-based diffractometer (Mo K $\alpha$ radiation, $\lambda=0.71073 \AA$ ). The raw frame data were integrated into SHELX-format reflection files and corrected for Lorentz and polarization effects using SAINT. ${ }^{1}$ Corrections for incident and diffracted beam absorption effects were applied using SADABS. ${ }^{1}$ None of the crystals showed evidence of crystal decay during data collection. All structures were solved by a combination of direct methods and difference Fourier syntheses and refined against $F^{2}$ by the full-matrix least squares technique. Crystal data, data collection parameters, and refinement statistics are listed in Table S1. Relevant interatomic bond distances, bond angles and H -bonds for $\mathbf{1}$ are given in Tables S2-3. Relevant interatomic bond distances, bond angles and H -bonds for $\mathbf{2}$ are given in Tables S4-5.
