

Supporting Information

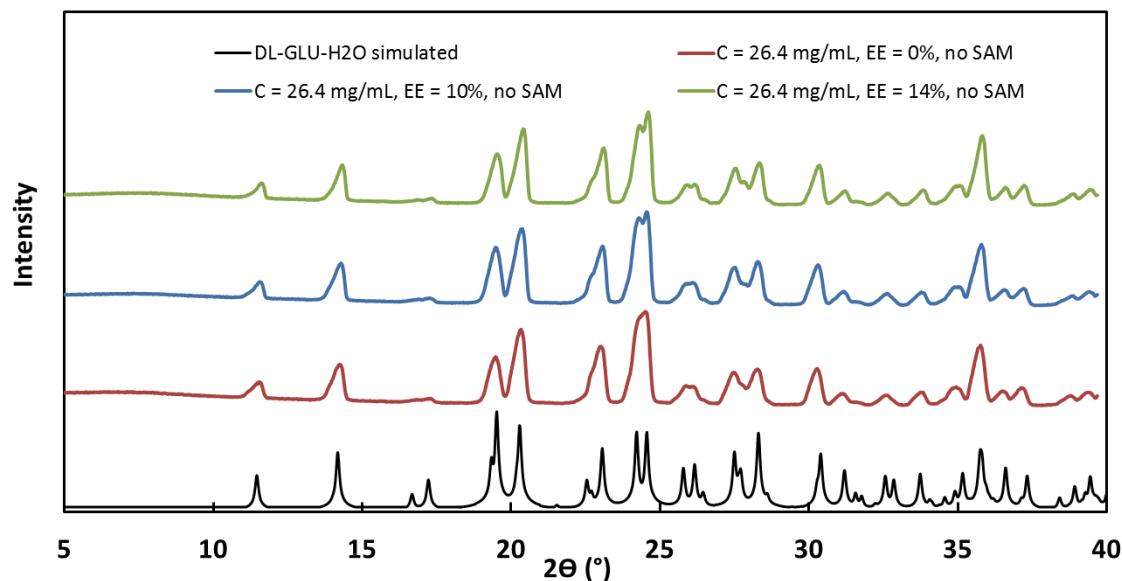

Figure S1. The XRPD pattern of glutamic acid crystals collected in the control experiments without using any SAM surface.

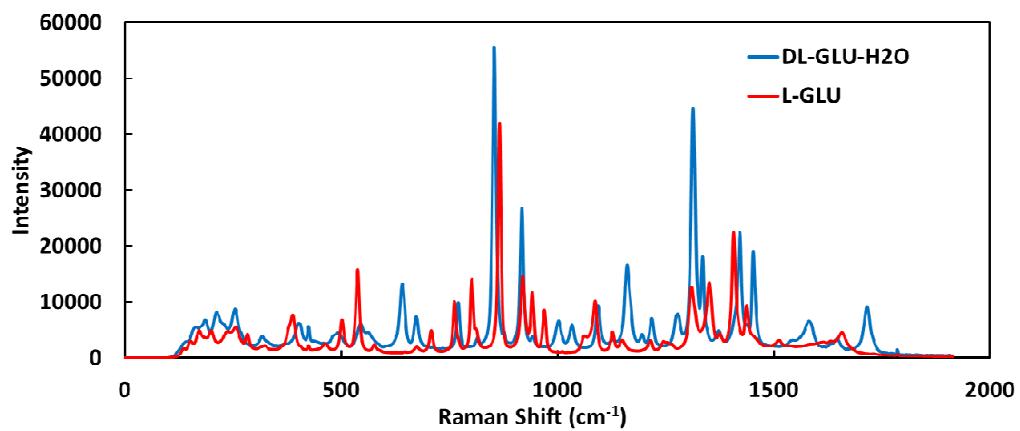

Figure S2. Raman spectra of DL-glutamic acid monohydrate and L-glutamic acid (the β polymorph).

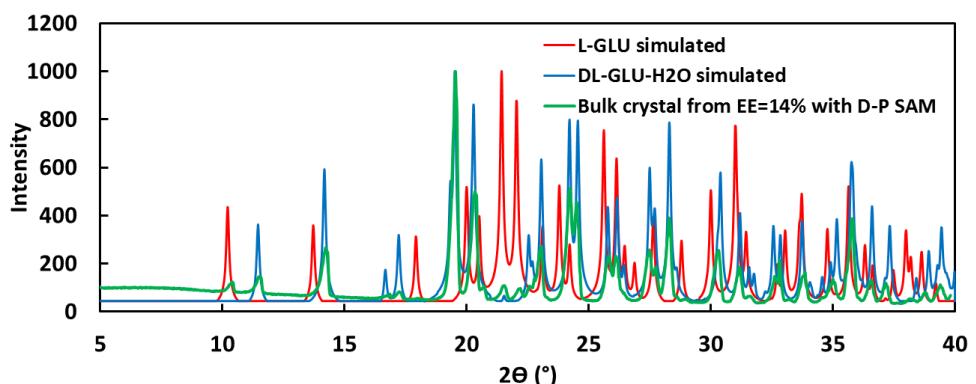

Figure S3. The XRPD pattern of crystals collected at the bottom of the crystallization vial ($C=26.4\text{ mg/mL}$, $\text{EE (L)} = 14\%$, SAM=D-P) and the simulated patterns of DL-glutamic acid monohydrate and L-glutamic acid (the β polymorph).

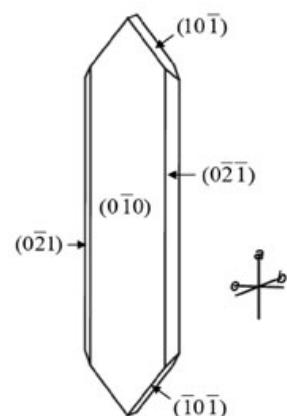

Figure S4. The morphology of L-glutamic acid crystal from bulk crystallization form aqueous solutions, obtained from reference 30.
