## 1. DFT calculations for $1-3$

All computational calculations on the gas-phase molecules were carried out using the density functional theory (DFT) in the Gaussian 03w program package (version E.01), performed at B3LYP level with $6-31 \mathrm{~g}(\mathrm{~d})$ basis set for all atoms [default parameters were used throughout]. ${ }^{1}$ The geometry optimizations were performed using the parameters from the crystal structures, where possible, as a starting point and their local minima were verified by the absence of imaginary frequencies. Zero-point vibrational frequencies were calculated on the optimized structures [default conditions were used: pressure at 1 atm and temperature at 298.15 K ]. Thermodynamic data were extracted from the zero-point vibrational energy calculations.

## 2. Solution state studies on 1

a. Chemical shifts of Hydroxyl protons of 1 in $\mathrm{CDCl}_{3}$

Fig. S1: Concentration dependence of chemical shift of the hydroxyl proton of $\mathbf{1}$ in $\mathrm{CDCl}_{3}$
b. Circular dichrosim spectrum of 1

Fig. S2. Circular dichrosim spectrum of $\mathbf{1}$ in $\mathrm{CHCl}_{3}$ and MeOH (c 0.0323 M , path 0.1 cm )

## c. The Diffusion Ordered Spectroscopy (DOSY) of 1 in $\mathbf{C D C l}_{3}$

Diffusion ordered spectroscopy was performed at $25{ }^{\circ} \mathrm{C}$, using 2 mg of heptakis(2,3,6-tri- $O$-methyl)- $\beta$-cyclodextrin (MW $=1429 \mathrm{gmol}^{-1}$ ) as internal standard in $\mathrm{CDCl}_{3} .{ }^{2,3}$ Ratios of diffusion coefficients of $\mathbf{1}$ to the standard were found to increase from 0.21 to 0.27 when concentrations of $\mathbf{1}$ were decreased from 118 mM to 1.85 mM .

Fig. S3. Concentration dependence of relative diffusion coefficient of $\mathbf{1}$ to internal reference (heptakis(2,3,6-tri- O-methyl)- $\beta$-cyclodextrin, physical separated) in $\mathrm{CDCl}_{3}$ at $25^{\circ} \mathrm{C}$.

## 3. Experimental

## General

( $R$ )-2-bromo- $\alpha$-methylbenzenemethanol, ${ }^{4}$ oxazaborole-borane catalyst $=$ (S)-tetrahydro-1-methyl-3,3-diphenyl-1H,3H-pyrrolo[1,2-c][1,3,2]oxazaborole-Borae ${ }^{5}$ and 1-(2-bromophenyl)-2,2-dimethylpropanone ${ }^{6}$ were prepared accordingly to literatures respectively. Solvent were dried using an appropriate drying agent when required (Hexane over sodium, THF and diethyl ether over Na /benzophenone, dichloromethane over calcium hydride). Dimethylformamide (DMF) was commercially available in anhydrous condition. All other chemicals were purchased commercially and used as received. Unless otherwise stated, all manipulations were
carried out under nitrogen using standard Schlenk line technique. Merck silica gel 60 (70-230 mesh) was used for column chromatography. NMR spectra were recorded on a Bruker Ultrashield Advance Pro 400 MHz instrument and the chemical shifts were referenced internally to tetramethylsilane (TMS) in parts per million (ppm). The enantiomeric excess of the alcoholic intermediates were determined by HPLC with a Daicel Chiralcel OJ-H or Regis (S,S) Whelk-O1 ( 4.6 mm X $250 \mathrm{~mm}, 5 \mu \mathrm{~m}$ particle size). The enantiomeric purity was compared with a racemic mixture according to the elution orders. The absolution configuration was determined with X-ray crystallography. CD spectra were recorded with a Jasco J-801 spectropolarimeter with a 1 mm cell at $25^{\circ} \mathrm{C}$ and presented as $\Delta \varepsilon$ in $\mathrm{M}^{-1} \mathrm{~cm}^{-1}$.

## X-ray crystallography

Measurements of crystal data were carried out on a Bruker Smart 1000 system equipped with an APEX II CCD device for $\mathbf{1 - 3}$, rac-1 and (S)-1-(2-bromophenyl)-2,2-dimethylpropan-1-ol with graphite monochromated Mo-K $\alpha$ radiation at room temperature. Multi-scan absorption correction was applied by SADABS program, ${ }^{7}$ and the SAINT program was utilized for integration of the diffraction profiles. ${ }^{8}$ The structures were solved by direct method and was refined by a full matrix least-squares treatment on $F^{2}$ using the SHELXTL programme system. ${ }^{9,10}$ Structure rac-1 contains a highly disordered lattice solvent $\left(\mathrm{CDCl}_{3}\right)$, and was removed from the refinement using the PLATON/SQUEEZE program. ${ }^{11}$ Crystal data, as well as details of data collection and refinement, are summarized in Table S1 and S2. Crystallographic data for the structural analysis has been deposited with Cambridge Crystallographic Data Centre, CCDC No. 845646 for 1; No. 845648 for 2; No. 845647 for 3; No. 894349 for rac-1; No. 894348 for (S)-1-(2-bromophenyl)-2,2-dimethylpropan-1-ol.

## H-atoms refinement

Proton refinements were performed through a number of ways for the structures reported in this manuscript. All carbon-bonded protons were refined using their respective riding model. Initially, attempts were made to locate hydroxyl protons using the Fourier difference map, with varying degree of success. A few hydroxyl protons could not be accurately located by means of Fourier synthesis due to a number of factors, namely the nature of proton in relation to single crystal X-ray crystallography, quality of data, and also disordering. These protons were refined using the theoretical riding model. Rotational disorder affects almost all hydroxyl protons. Hydrogen bondings in these structures can take up different orientations, meaning that the hydroxyl protons can take up more than one position depending on
the direction of the hydrogen bonding in the overall structure. The implication of this can often be seen during the Fourier syntheses in one of the two following forms: two potential proton peaks pointing almost at each other or; a single peak obtained roughly in the middle of two oxygen atoms (donor-acceptor pair). Free refinements in these cases often lead to unreasonable bond lengths and angles, and can only be rectified by using appropriate constraints such as AFIX or DFIX. Only in the case of BCYCT05 was the data was of good enough quality to allow the disorder of protons to be shown but DFIX was still necessary in order to keep the protons at reasonable distance to the oxygen atoms.

## Synthetic routes to 1-3

## Procedure for preparation of 1

$(R)$-2-bromo- $\alpha$-methylbenzenemethanol ( $1.00 \mathrm{~g}, 5 \mathrm{mmol}$ ) was added to a suspension of $\operatorname{bis}(1,5-c y c l o o c t a d i e n e) n i c k e l(0)\left(N i(C O D)_{2}\right)(0.94 \mathrm{~g}, 3.4 \mathrm{mmol})$ in 6 mL DMF under nitrogen. The mixture was then heated at $45{ }^{\circ} \mathrm{C}$ for 16 hrs . After cooling to room temperature, the reaction was quenched by the addition of $5 \%$ aqueous HCl and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The extract was dried with $\mathrm{MgSO}_{4}$ and purified with column chromatography (petroleum ether/ethyl acetate). After collecting the product portion, the solid was dissolved in warm $\mathrm{Et}_{2} \mathrm{O}$. Crystal was slowly formed upon cooling of the solution. The crystal was collected and then dried in vacuum to give $\mathbf{1}$ as colourless solid ( $0.67 \mathrm{~g}, 2.75 \mathrm{mmol}, 55 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$, $\delta$ ): 1.40 (d, $J=6.4 \mathrm{~Hz}, 6 \mathrm{H}), 2.71(\mathrm{~s}, 2 \mathrm{H}), 4.57(\mathrm{q}, J=6.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.11$ (dd, $J=7.2$, $0.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.31(\mathrm{td}, J=7.2,1.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.44(\mathrm{td}, J=7.2,0.8 \mathrm{~Hz}, 2 \mathrm{H}), 7.62(\mathrm{dd}, J=$ $8,1.2 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, \delta\right): 23.5,65.9,125.3,127.1,128.2,129.5,139.0$, 143.1.

## Procedure for preparation of 2

Acetic anhydride ( $2.1 \mathrm{~mL}, 22.2 \mathrm{mmol}$ ) was added dropwise to a solution of $(R)$-2-bromo- $\alpha$-methylbenzenemethanol ( $1.68 \mathrm{~g}, 8.3 \mathrm{mmol}$ ) and pyridine $(1.70 \mathrm{~mL}$, $21.02 \mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was allowed to stir at room temperature for 16 h . After quenching the reaction with water, the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ three times. The combined organic layers were washed with brine and then dried over $\mathrm{MgSO}_{4}$. The solvent was removed under reduced pressure to give an oily product ( $1.89 \mathrm{~g}, 7.78 \mathrm{mmol}, 94 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): 1.52 (d, $J=$ $6.4 \mathrm{~Hz}, 3 \mathrm{H}), 2.10(\mathrm{~s}, 3 \mathrm{H}), 4.28(\mathrm{q}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.14(\mathrm{td}, J=8.0,1.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.32$ ( td, $J=7.2,0.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.44(\mathrm{dd}, J=7.6,1.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.53(\mathrm{dd}, J=8.0,0.8 \mathrm{~Hz}, 1 \mathrm{H})$. ${ }^{13} \mathrm{C}^{\mathrm{NMR}}\left(\mathrm{CDCl}_{3}, \delta\right): 19.23,36.33,76.97,117.71,121.60,122.41,123.49,126.55$, 133.31, 156.46.

The coupling method for $\mathbf{2}$ is similar to the preparation of $\mathbf{1}$ except $(R)$-1-(2-bromophenyl)-ethyl acetate ( $2.62 \mathrm{~g}, 10.8 \mathrm{mmol}), \mathrm{Ni}(\mathrm{COD})_{2}(2 \mathrm{~g}, 7.27 \mathrm{mmol})$ and 12 mL of DMF were used and the reaction was heated to $65{ }^{\circ} \mathrm{C}$. The crude product was purified with column chromatography yielding colourless solid ( 2.6 g , $7.89 \mathrm{mmol}, 73 \%$ yield). Two sets of peaks which are in a ratio of 53:47 were observed in ${ }^{1} \mathrm{H}$ NMR. The $\left(R, R_{\mathrm{a}}, R\right)-\mathbf{2}$ isomer can be obtained as a pure isomeric solid by repeatedly recrystallization from warm $\mathrm{Et}_{2} \mathrm{O}$ solution of $2(1.62 \mathrm{~g}, 4.97 \mathrm{mmol}) .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): $1.36(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 6 \mathrm{H}), 2.01(\mathrm{~s}, 6 \mathrm{H}), 5.68(\mathrm{q}, J=6.4 \mathrm{~Hz}$, $2 \mathrm{H}), 7.26-7.27(\mathrm{~m}, 2 \mathrm{H}), 7.34(\mathrm{t}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.42(\mathrm{t}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 7.57(\mathrm{t}, J=$ $7.6 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, \delta\right): 21.25,21.26,69.43,126.02,127.55,128.20$, $130.28,138.42,139.32,169.85$. Isolation of the compound corresponding to another set of peak was not possible since the two compounds were equilibrated

## Procedure for preparation of 3

1-(2-bromophenyl)-2,2-
dimethylpropanone
(S)-1-(2-bromophenyl)-

2,2-dimethylpropan-1-ol

1-(2-bromophenyl)-2,2-dimethylpropanone ( $1 \mathrm{~g}, 4.15 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.2 \mathrm{~mL})$ was added dropwise to a solution of oxazaborole-borane catalyst $(0.06 \mathrm{~g}, 0.21 \mathrm{mmol})$ and borane-dimethyl sulfide $(0.39 \mathrm{~mL}, 4.15 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.26 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 6 h . After completion of reaction conversion, the reaction was precooled to $-20^{\circ} \mathrm{C}$ and then quenched carefully with dropwise addition of methanol ( 1 mL ). The product was extracted with $\mathrm{Et}_{2} \mathrm{O}$ and dried with $\mathrm{MgSO}_{4}$. The crude product was purified with column chromatography yield colourless solid ( 0.81 $\mathrm{g}, 3.32 \mathrm{mmol}, 80 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}, \delta$ ): $1.00(\mathrm{~s}, 9 \mathrm{H}), 1.87(\mathrm{~d}, J=$ $3.2 \mathrm{~Hz}, 2 \mathrm{H}), 5.00(\mathrm{~d}, J=3.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.11(\mathrm{td}, J=7.6,1.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.31(\mathrm{t}, J=7.6$ $\mathrm{Hz}, 2 \mathrm{H}), 7.53(\mathrm{~m}, 4 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, \delta\right): 0.02,25.91,37.04,124.10,126.89$, $128.72,129.62,132.59,141.55$. The enantiomeric purity was determined with HPLC with Whelk-O1 column (Hexane/i-propanol: 98/2; flow rate: $0.7 \mathrm{ml} / \mathrm{min}$ ) and compared with a racemic mixture according to the elution orders with retention times, $\mathrm{t}_{\mathrm{S}}=7.98 \mathrm{~min}$ and $\mathrm{t}_{\mathrm{R}}=10.0 \mathrm{~min}$ ) to be $95 \%$ ee. The absolution configuration was determined with X-ray crystallography (Fig. S4).

Fig. S4. X-ray crystallography of (S)-1-(2-bromophenyl)-2,2-dimethylpropan-1-ol showing $(S)$ configuration at C40.

|  | $\mathrm{C} 15-\mathrm{H} 15 \mathrm{~A} \cdots \mathrm{Cg} 13$ | 3.20 | $3.849(4)$ | 129 | Intermolecular |

| $\mathrm{C} 18-\mathrm{H} 18 \mathrm{~A} \cdots \mathrm{Cg} 14$ | 3.09 | $3.840(6)$ | 137 | Intermolecular |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{C} 33-\mathrm{H} 33 \mathrm{~A} \cdots \mathrm{Cg} 14$ | 3.16 | $4.064(4)$ | 164 | Inter-tetramer |

$\mathrm{Cg} 1,4-6$ are the centroids of aryl ring C21-C26, C11-C16, C31-C36 and C41-C46 of 1, respectively. Cg 7 and Cg 8 are the centroids of aryl ring $\mathrm{C} 1-\mathrm{C} 6$ and $\mathrm{C} 12-\mathrm{C} 17$ of 3 , respectively. $\mathrm{Cg} 9-14$ are the centroids of aryl ring C21-C26, C31-C36, C41-C46, C51-C56, C61-C66 and C71-C76 of rac-1, respectively.

Table S6. Crystal data and structure refinement of 1-3 and rac-1

|  | 1 | 2 | 3 | rac-1 |
| :---: | :---: | :---: | :---: | :---: |
| Empirical formula | C16 H18 O2 | C20 H22 O4 | C22 H30 O2 | C16 H18 O2 |
| Formula weight | 242.30 | 326.38 | 326.46 | 242.30 |
| Temperature | 296(2) K | 296(2) K | 296(2) K | 296(2) K |
