Content

1- Selected bond lengths and angles of compounds **1-3**.

2- Powder X-ray diffraction of compounds **1-3**.

3- Additional TG curves of **1-3**.

4- Additional Gas sorption isotherms for compound **1**.

5- Analysis of Gas Sorption Isotherms.

1- Selected bond lengths and angles of compounds 1-3

Table S1 Selected bond lengths (\AA) and angles ($^\circ$) for **1**.

2- Powder X-ray diffraction of compounds 1-3

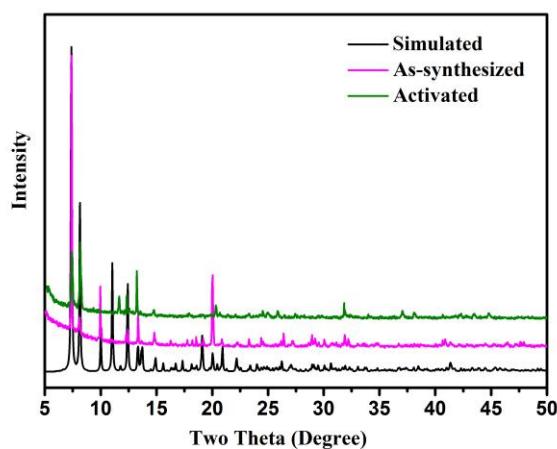

Figure S1. X-ray powder diffraction patterns of compound **1**.

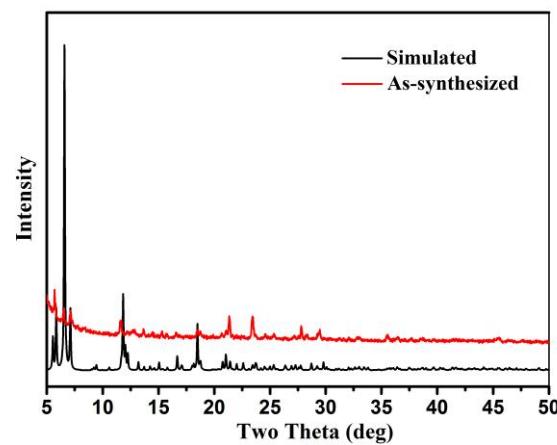

Figure S2. X-ray powder diffraction patterns of compound **2**.

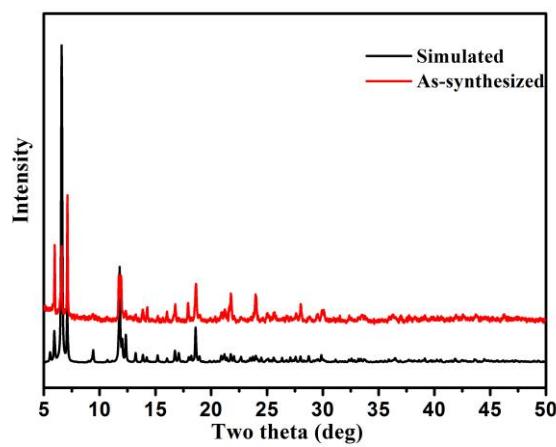

Figure S3. X-ray powder diffraction patterns of compound **3**.

3- Additional TG curves of **1–3**.

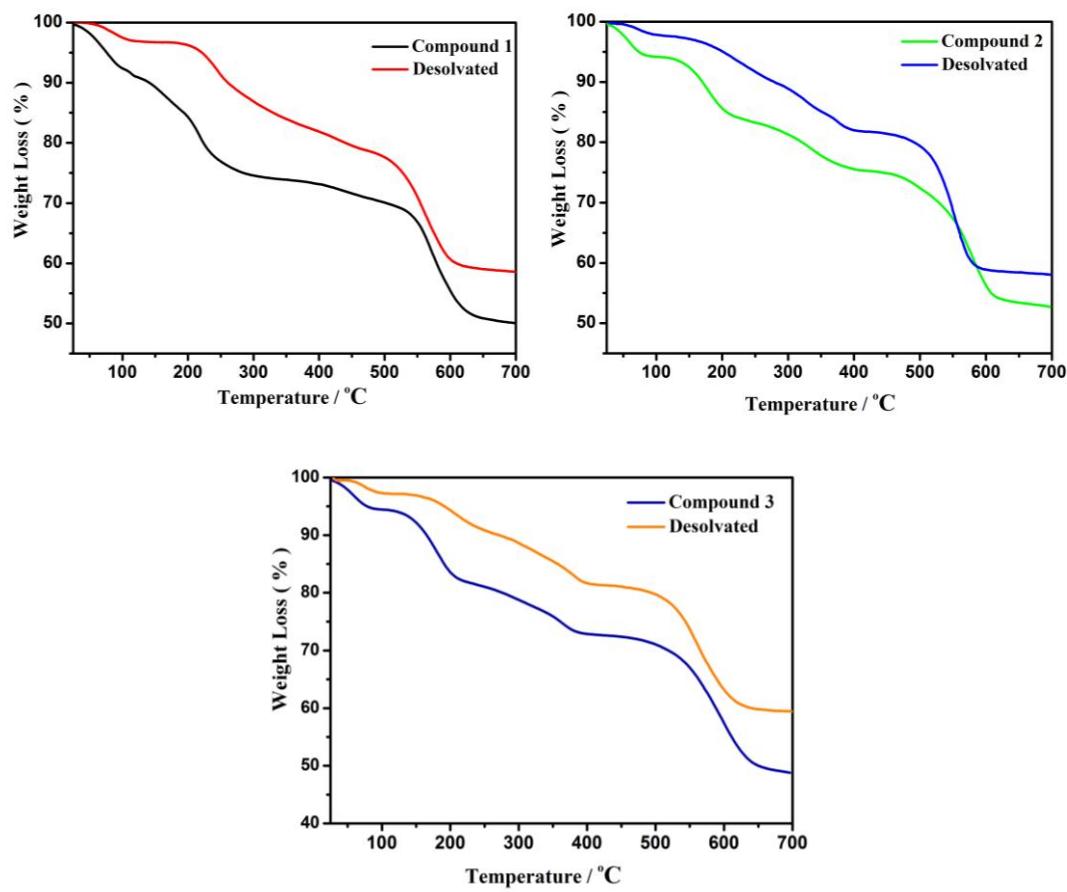

Figure S4. TGA profiles under nitrogen for compounds **1–3**.

4- Additional Gas sorption isotherms for compound **1**

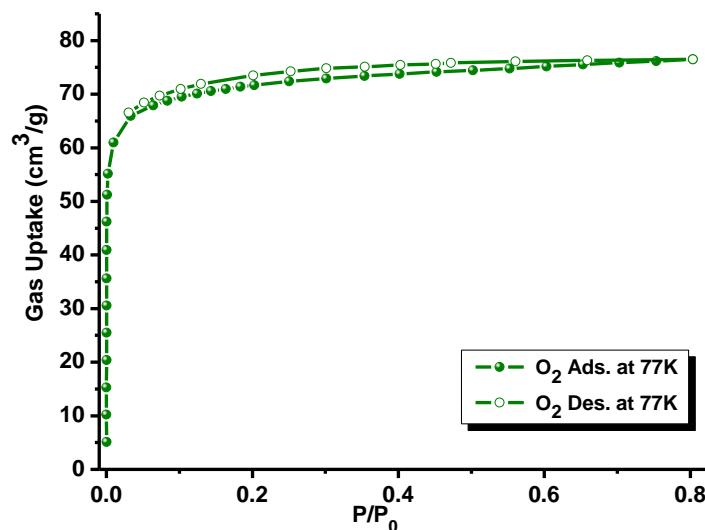

Figure S5. Gas sorption isotherms of **1** for O₂ at 77 K.

5- Analysis of Gas Sorption Isotherms.

Several isotherm models were tested to fit the experimental pure isotherms for CO₂ and CH₄, and the dual-site Langmuir-Freundlich equation was found to best fit the experimental data according to the literature.^{S1}

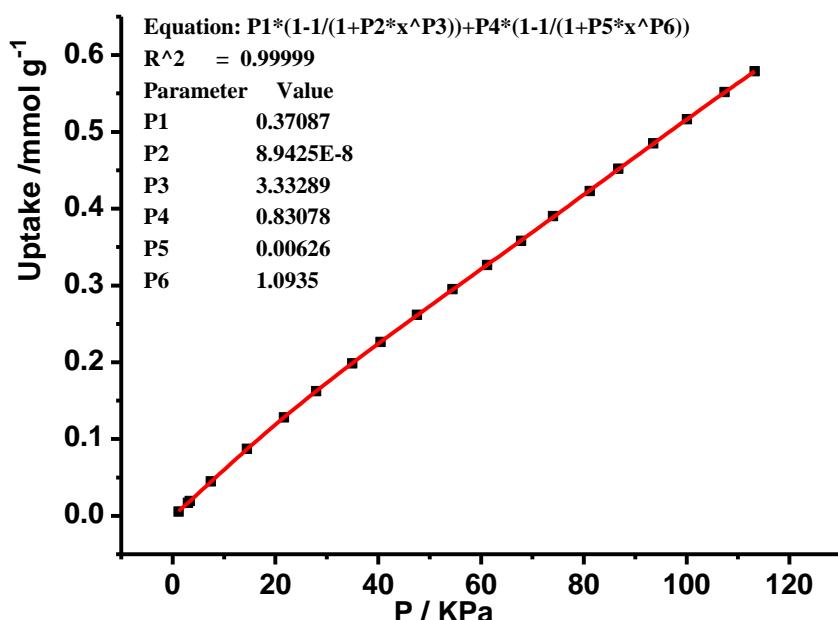

$$q = q_{m1} \times \frac{b_1 \times P^{1/n_1}}{1 + b_1 \times P^{1/n_1}} + q_{m2} \times \frac{b_2 \times P^{1/n_2}}{1 + b_2 \times P^{1/n_2}} \quad (\text{I})$$

Here, P is the pressure of the bulk gas at equilibrium with the adsorbed phase (kPa), q is the adsorbed amount per mass of adsorbent (mmol/g), q_{m1} and q_{m2} are the saturation capacities of sites 1 and 2 (mmol/g), b₁ and b₂ are the affinity coefficients of sites 1 and 2 (1/kPa), and n₁ and n₂ represent the deviations from an ideal homogeneous surface.

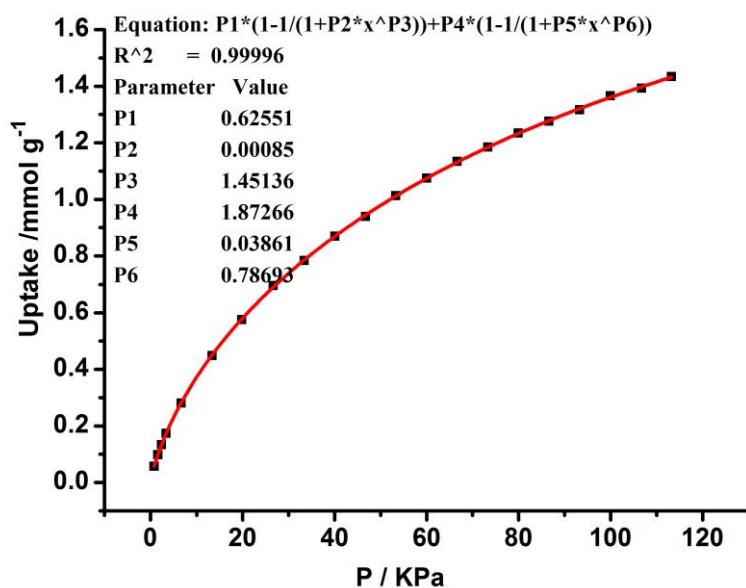

Equation (I) rearranges to:

$$y = P1 \times \frac{P2 \times x^{P3}}{1 + P2 \times x^{P3}} + P4 \times \frac{P5 \times x^{P6}}{1 + P5 \times x^{P6}} \quad (\text{II})$$

(1) Fitting CH₄ adsorption isotherms using the dual-site Langmuir-Freundlich equation

(2) Fitting CO₂ adsorption isotherms using the dual-site Langmuir-Freundlich equation

(3) The IAST-predicted isotherms and selectivities of equimolar mixtures of CO₂ and CH₄ at 273 K. The selectivity S_{CO₂/CH₄} in a binary mixture of components CO₂ and CH₄ is defined as (x_{CO₂}/y_{CO₂})/(x_{CH₄}/y_{CH₄}), where x_i and y_i are the mole fractions of component i (i = CO₂, CH₄) in the adsorbed and bulk phases, respectively.

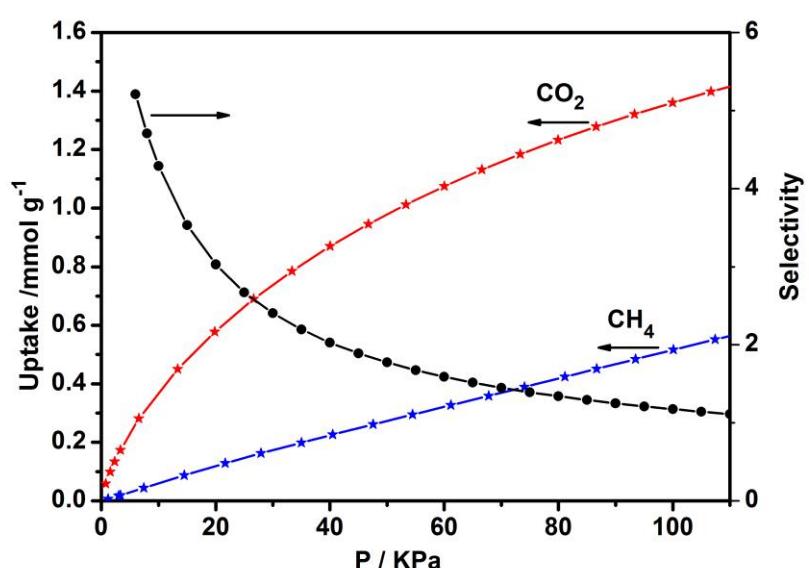

Figure S6. IAST selectivity of CO_2 over CH_4 at 273K.
