SI 1. Experimental section	2
SI 2. Physical characterisation	2
SI 3. Crystal data and structure refinement for <i>O</i> , <i>O</i> -CPBN, 1-2 and 4-7	4
SI 4. Ortep representation of asymmetric unit and crystal packing of <i>O</i> , <i>O</i> -CPB	<b>N</b> 6
<b>SI 5</b> . Ortep representation of asymmetric unit, $Ag(I)$ coordination bond lengths	and
bond angles and crystal packing of <b>1</b>	7
SI 6. Ortep representation of asymmetric unit, $Ag(I)$ coordination bond length a	nd
bond angles and crystal packing of <b>2</b>	8
SI 7. Thermo-gravimetric analysis of 1-4	10
<b>SI 8</b> . IR spectra of <b>1-7</b>	10
SI 9. Ortep representation of asymmetric unit, $Ag(I)$ coordination bond length a	nd
bond angles and crystal packing of <b>4</b> with H-bonding	11
SI 10. Conformational diversity of <i>O</i> , <i>O</i> -CPBN in 1-2 and 4-7.	14
SI 11. PXRD patterns of 1-4	16
SI 12. Comparison of experimental PXRD patterns of 1-2 and 4-7 with	
simulated pattern from single crystal data	16
SI 13. Ortep representation of asymmetric unit, $Ag(I)$ coordination bond length	and
bond angles and crystal packing of <b>5</b>	19
SI 14. Ortep representation of asymmetric unit, $Ag(I)$ coordination bond length	and
bond angles and crystal packing of $6$	20

## **SI 1**

#### **Experimental Section**

*Chemicals:* All the chemicals were obtained from Aldrich and used as received. Solvents were used without purifications or drying. *O*, *O*-bis-cyanophenoxy benzonitrile (*O*, *O*-CPBN) was synthesized following the literature procedure.<sup>1</sup>

Synthesis of Ag(1)-O, O-CPBN coordination polymer (1-7):  $Ag(1)CF_3SO_3$ (102 mg, 0.4 millimoles) and O, O-CPBN (88 mg. 0.4 millimoles) were dissolved separately in hot toluene (5 ml each) and brought to room temperature before the solutions mixed together. On standing needle-shaped single crystals of **1** were formed after 12 h (yield = 95%). Recrystallization of **1** (dissolving under hot conditions, but with crystal formation at room temperature) or repeating the procedure using ethyl acetate produced crystals of **2** (yield = 95%). The addition of toluene solutions of  $Ag(I)CF_3SO_3$  (102 mg, 0.4 millimoles, 5 ml) and O, O-CPBN (176 mg, 0.8 millimoles, 5 ml) at room temperature produced coordination polymer gel (**3**) after standing for 20 h. **3** slowly transformed into single crystals of **4** on standing at room temperature for more than two weeks (yield = 50%).

#### **SI 2**

#### **Characterization:**

*X-ray diffraction:* PXRD measurements were recorded using a Siemens diffraktometer-D500 at room temperature. Single crystals were carefully chosen after they were viewed through a polarizing microscope. The crystals were glued to a thin glass fibre using an adhesive (cyano acrylate) and mounted on a diffractometer equipped with an Bruker SMART APEX CCD area detector (O, O-CPBN, 1, 2, 5, 6) and Rigaku Saturn-724 HG CCD detector (4 and 6. The data collections were carried out at 150K and no extraordinary methods were employed, except that the crystals were smeared in NIH immersion oil to protect them from ambient laboratory conditions. The intensity data were processed using Bruker's suite of data processing programs (SAINT), and absorption corrections were applied using SADABS.<sup>2</sup> The

structure solution of all the complexes was carried out by direct methods, and refinements were performed by full-matrix least-squares on  $F^2$  using the SHELXTL-PLUS<sup>2</sup> suite of programs. All the structures converged to good *R* factors. All the non-hydrogen atoms were refined anisotropically, and the hydrogen atoms were fixed on calculated positions using appropriate HFIX options in Shelxtl and were refined isotropically. Intermolecular interactions were computed using the PLATON program.<sup>3</sup>

TGA was carried out using Perkin-Elmer Pyris 1 TG analyzer and the experiments were carried out in an inert atmosphere with a heating rate of 10 °C/min. IR spectra were recorded on a Perkin-Elmer spectrometer with ATS Sampling Accessory. The morphology of coordination polymer gel was examined using field emission scanning electron microscopy (FE-SEM, Hitachi S-4300) at acceleration voltage at 5 kV. Prior to analysis, the samples were coated with a thin layer of gold. CD was carried out using Jasco-J815 CD spectrometer by spreading the crystalline sample on glass plate.
