## Crystal Structures of the Free Acids.

TMBTA. Diffraction quality single crystals of TMBTA were harvested from a mixture of ethanol, ethyl acetate, and hexane. It crystallized in the centrosymmetric monoclinic space group $\mathrm{P} 2_{1} / \mathrm{n}$. The asymmetric unit contained one molecule of TMBTA and half a molecule of ethanol as solvent. The terminal methyl group and the hydroxyl group of the ethanol molecule were found to be disordered over two positions and the whole molecule was further disordered around a centre of inversion. The carboxymethyl arms of the acid moiety adopted syn-syn-anti conformation. The torsion angles involving the carboxylmethyl arms and the aromatic ring were calculated to be $93.2,98.1$ and $100.8^{\circ}$, respectively. All the carboxylic acid -OH displayed syn conformation. In the crystal structure, TMBTA molecule held three neighbouring acid molecules via $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ interactions $\left[\mathrm{O} \cdots \mathrm{O}=2.661(5)-2.698(4) \AA ; \angle \mathrm{O}-\mathrm{H} \cdots \mathrm{O}=168.8-176.2^{\circ}\right]$ displaying typical carboxylic acid dimer. Such hydrogen bonding ultimately lead to the formation of 1D tape architecture having cavities that were occupied by the disordered solvent molecules; such 1D tapes were packed in parallel fashion (Fig.1A-B).
TEBTA. The single crystals of TEBTA, suitable for the X-ray diffraction study were grown from a methanol and ethyl acetate solvent mixture. It was found to be isomorphous with TMBTA displaying identical space group ( $\mathrm{P} 2_{1} / \mathrm{n}$ ) and near identical cell dimensions. The asymmetric unit contained a molecule of TEBTA. Installation of comparatively more bulky ethyl groups in the place of methyl did not affect the conformation of the carboxymethyl groups relative to the aromatic ring. Thus, TEBTA also adopted syn-syn-anti conformation. The relative orientation of the carboxylmethyl moieties with respect to the aromatic ring as revealed from the corresponding dihedral angels of $92.8,97.8$ and $108.7^{\circ}$ was similar to that observed for TMBTA. In this case also, - OH of the COOH moieties adopted syn conformation and each one of them displayed typical hydrogen bonded carboxylic acid dimer synthon sustained by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ interactions $\left[\mathrm{O} \cdots \mathrm{O}=2.649(9)-2.679(8) \AA ; \angle \mathrm{O}-\mathrm{H} \cdots \mathrm{O}=121.2-165.6^{\circ}\right]$. Such interactions led to the formation 1D hydrogen bonded tapes similar to that observed in TMBTA. Interestingly, the cavities within the 1D hydrogen bonded tape remained unoccupied. Such 1D tape was found to be packed in parallel fashion resulting in an overall open-framework structure (Fig.1C-D).

## Crystal Structures of the Salts.

TMBTA.DCHA. The isolated salt TMBTA.DCHA was subjected to FT-IR wherein disappearance of $v_{\mathrm{C}=\mathrm{O}}$ for the parent acid at $1697 \mathrm{~cm}^{-1}$ and appearance of a new band at around $1610 \mathrm{~cm}^{-1}$ suggested complete deprotonation and formation of $1: 3$ (acid : amine) salt. The single crystals of TMBTA.DCHA were grown from toluene. It crystallized in the non-centrosymmetric orthorhombic space group Fdd2. The C-O bond distances were found to be within the range of 1.241(3)-1.255(2) Å indicating the deprotonation of all the three carboxylic acid groups which corroborated well with the FT-IR data. The asymmetric unit contained one carboxylate moiety, three dicyclohexyl ammonium cation and one water molecule. The carboxymethyl groups displayed syn-syn-anti conformation as observed in the crystal structure of its parent acid. The dihedral angles involving the carboxymethyl groups and the aromatic ring were found to be 92.2 , 92.4 and $94.5^{\circ}$ which were quite different from its free acid. This could be because of the various hydrogen bonding interactions involving the $\mathrm{COO}^{-}$and ammonium cations. In fact, various hydrogen bonding of the type $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ interactions governed the crystal structure; each tricarboxylate moiety was found to be holding five ammonium cations via $\mathrm{N}-\mathrm{H} \cdot \cdots \mathrm{O}$ interactions $[\mathrm{O} \cdot \cdots \mathrm{N}=2.674(3)-3.107(3) \AA ; \angle \mathrm{O}-$
$\left.\mathrm{H} \cdot \cdots \mathrm{N}=130.8-172.3^{\circ}\right]$. The solvent water molecule was involved in hydrogen bonding with the two neighbouring $\mathrm{COO}^{-}$via $\mathrm{O}-\mathrm{H} \cdots \cdot \mathrm{O}$ interactions $\left[\mathrm{O} \cdots \mathrm{O}=2.748(4)-2.827(3) \AA ; \angle \mathrm{O}-\mathrm{H} \cdots \mathrm{O}=151(3)-156(4)^{\circ}\right]$. The overall hydrogen bonded network was found to be 3D (Fig.2A-B).

TEBTA.DCHA. On the other hand, the FT-IR of the isolated salt TEBTA.DCHA displayed the presence of $1564 \mathrm{~cm}^{-1}$ band which was attributed to $v_{\mathrm{C}=\mathrm{O}}$ of $\mathrm{COO}^{-}$; absence of $v_{\mathrm{C}=\mathrm{O}}$ for COOH at $1699 \mathrm{~cm}^{-1}$ for the parent acid confirmed complete deprotonation and formation of $1: 3$ (acid : amine) salt TEBTA.DCHA. Single crystals of the salt were grown from 1,4-dioxane and methanol mixture. It crystallised in the centrosymmetric monoclinic space group $\mathrm{P}_{1} / \mathrm{n}$. The asymmetric unit contained one mono-anionic acid moiety, one ammonium moiety and one water molecule. Further examination showed that only one of the three COOH groups of the acid moiety was deprotonated as revealed from the $\mathrm{C}-\mathrm{O}$ bond distances [1.1914(17)-1.3096(16) $\AA$; $1.2155(15)-1.3165(14) \AA$ for COOH and $1.2682(15)-1.2393(14) \AA$ for $\left.\mathrm{COO}^{-}\right]$. Thus, it was clear that upon crystallization, the salt TEBTA.DCHA crystallized out as $1: 1$ monohydrate salt. In this case also, the carboxymethyl groups displayed syn-syn-anti conformation; the ethyl substituents also displayed the same conformation. The torsion angles involving the carboxylmethyl arms and the aromatic ring were $94.4^{\circ}, 97.7^{\circ}$ and $98.0^{\circ}$. While -OH of one COOH adopted anti conformation, the other one showed syn. In the crystal structure, the COOH and $\mathrm{COO}^{-}$moieties of the adjacent monoanions formed a 1D hydrogen bonded chain $\left[\mathrm{O}-\mathrm{H} \cdots \mathrm{O}=2.5572(12) \AA ; \angle \mathrm{O}-\mathrm{H} \cdot \cdots \mathrm{O}=163.6^{\circ}\right]$; the ammonium cation was located within such chain sustained by $\mathrm{N}-\mathrm{H} \cdots \cdot \mathrm{O}$ hydrogen bonding $[\mathrm{O} \cdots \mathrm{N}=$ $\left.2.7630(13)-2.8101(13) \AA ; \angle \mathrm{O}-\mathrm{H} \cdot \cdot \cdot \mathrm{N}=156.6-164.2^{\circ}\right]$ with the COOH and $\mathrm{COO}^{-}$of the same acid moiety. Such 1D chains were arranged in parallel fashion sustained by $\mathrm{O}-\mathrm{H} \cdot \cdots \mathrm{O}[\mathrm{O} \cdots \mathrm{O}=2.5698(14)-2.7713(14)$ $\left.\AA ; \angle \mathrm{O}-\mathrm{H} \cdot \cdots \mathrm{O}=165.1(18)-177.7^{\circ}\right]$ hydrogen bonding interactions involving the solvent water molecules resulting in an overall 2D hydrogen bonded layer structure that packed in parallel fashion (Fig.2C-D).

TMBTA.DPA. In TMBTA.DPA, $v_{\mathrm{C}=0}$ for both $\mathrm{COOH}\left(1701 \mathrm{~cm}^{-1}\right)$ and $\mathrm{COO}^{-}\left(1585 \mathrm{~cm}^{-1}\right)$ were present in the FT-IR of the isolated salt indicating the acid and the amine did not react in desired 1:3 molar ratio. The single crystals of the salt were harvested from isopropanol. It crystallised in the centrosymmetric monoclinic space group $\mathrm{P} 2_{1} / \mathrm{c}$. The asymmetric unit contained one ion-pair wherein the dipropylammonium (DPA) cation was found to be disordered. The fact that only one of the three COOH groups was deprotonated was evident from the corresponding C-O bond lengths [1.209(5)-1.289(5) $\AA$; 1.223(4)-1.308(4) $\AA$ for COOH and 1.218(4)-1.281(4) $\AA$ for $\left.\mathrm{COO}^{-}\right]$indicating the formation of $1: 1$ salt. Interestingly, all the carboxymethyl arms were oriented in syn-syn-syn conformation. The torsion angles involving the carboxymethyl arms and the aromatic ring were $92.2,92.4$ and $92.8^{\circ}$. Both syn and anti conformation were observed for the -OH of the two COOH groups. The monoanions were self-assembled via $\mathrm{COO} \cdots \mathrm{HOOC}$ hydrogen bonding $\left[\mathrm{O} \cdots \mathrm{O}=2.553(4)-2.639(5) \AA ; \angle \mathrm{O}-\mathrm{H} \cdot \cdots \mathrm{O}=168.8-174.2^{\circ}\right]$ resulting in a 2D hydrogen bonded sheet architecture. The disordered DPA units were found to be intercalated within two such parallel 2D sheets sustained via $\mathrm{N}-\mathrm{H} \cdot \cdots \mathrm{O}$ interactions [2.771-2.848 $\AA$ ] involving the ammonium cation and carboxylic moieties resulting in 2D layered hydrogen bonded network. Such 2D networks were further packed in parallel fashion sustained by $\pi-\pi$ stacking ( $4.04 \AA$ ) interactions (Fig.3AB).

TEBTA.DPA. FT-IR of the isolated salt TEBTA.DPA showed bands at 1703 and $1562 \mathrm{~cm}^{-1}$ which indicated the presence of both COOH and $\mathrm{COO}^{-}$suggesting incomplete deprotonation of COOH groups.

Diffraction quality single crystals of the salt were grown from methanol. It crystallized in the noncentrosymmetric monoclinic space group $\mathrm{P} 2_{1} / \mathrm{c}$. The asymmetric unit contained two ion pair compriseds of monoanionic acid moieties and dipropyl ammonium (DPA) cations. The fact that two of the three COOH groups in each moiety remained protonated was evident from the C-O bond distances [1.202(6)-1.314(6) $\AA ; 1.215(6)-1.304(6) \AA$ for COOH and $1.226(6)-1.281(6) \AA$ for $\left.\mathrm{COO}^{-}\right]$. These data clearly indicated that TEBTA.DPA was a $1: 1$ salt and In this salt, both ethyl and carboxymethyl moieties displayed syn-synsyn conformation; however, the relative orientation of the ethyl and carboxymethyl was anti. The torsion angles involving the carboxymethyl arms and the aromatic ring were $-90.00-90.56^{\circ},-92.95^{\circ}-95.77$-and -$93.48-92.75^{\circ}$, respectively. The - OH of the COOH groups displayed both anti and syn conformation. The monoanions were self-assembled to form 2D hydrogen bonded sheet sustained by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}[\mathrm{O} \cdots \mathrm{O}=$ 2.520(5)-2.582(5) $\left.\AA ; \angle \mathrm{O}-\mathrm{H} \cdots \mathrm{O}=164.8^{\circ}-173.2^{\circ}\right]$ interactions involving the COOH and $\mathrm{COO}^{-}$moieties. Such 2D sheets were further packed in parallel fashion bridged by the ammonium cations that displayed N $\mathrm{H} \cdots \mathrm{O}\left[\mathrm{O} \cdots \cdot \mathrm{N}=2.765(7)-2.798(7) \AA ; \angle \mathrm{O}-\mathrm{H} \cdot \cdots \mathrm{N}=152.8-165.3^{\circ}\right]$ interactions with various O atoms of the $\mathrm{COOH} / \mathrm{COO}^{-}$moieties of the interacting 2D sheets resulting in 2D layered structure. Since the ethyl groups were oriented opposite to the carboxymethyl arms, no $\pi-\pi$ stacking interactions could be observed although the 2D layered structures were packed in parallel fashion (Fig.S1).

Fig.S1. Crystal structure illustration of TEBTA.DPA; A) 2-D hydrogen bonded sheet involving the anionic moieties; B) parallel packing of the 2-D layered structure.

TMBTA.DIBUA. The salt TMBTA.DIBUA showed two bands at 1708 and $1552 \mathrm{~cm}^{-1}$ in its FT-IR spectrum which indicated the presence of both COOH and $\mathrm{COO}^{-}$in the synthesized solid. The single crystals suitable for the diffraction study were grown from methanol, which crystallised in the centrosymmetric monoclinic space group $\mathrm{P}_{1} / \mathrm{c}$. The asymmetric unit contained one acid moiety and one diisobutylammonium (DIBUA) cation. Various C-O bond lengths [1.203(3)-1.293(3) $\AA$ for COOH; 1.215(2)-1.314(2) and 1.234(2)-1.272(2) $\AA$ for $\left.\mathrm{COO}^{-}\right]$present in the crystal structure clearly established the monoanionic nature of the acid moiety. The carboxymethyl groups displayed syn-syn-syn conformation. The torsion angles involving the carboxymethyl groups and the aromatic rings were found to be $94.0,97.9$ and $98.5^{\circ}$ respectively. The relative orientation of the carboxylic acid protons were found be syn and anti. The monoanionic species were self-assembled via $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}[\mathrm{O} \cdots \mathrm{O}=2.575(2) \AA \AA-2.578(2)$ $\AA ; \angle \mathrm{O}-\mathrm{H} \cdots \mathrm{O}=161.2^{\circ}-164.9^{\circ}$ ] interactions involving the COOH and $\mathrm{COO}^{-}$moieties resulting in 2 D sheet architecture. The cationic species were located within the interstitial space between two such 2 D sheets
sustained by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ interactions $\left[\mathrm{O} \cdots \mathrm{N}=2.803(2)-2.872(3) \AA ; \angle \mathrm{O}-\mathrm{H} \cdot \cdots \mathrm{N}=152.6-171.2^{\circ}\right]$; in this case, the ammonium cation was found to be involved in hydrogen bonding interactions with COOH and $\mathrm{COO}^{-}$ of the same acid moiety. In the overall packing, the syn-syn-syn conformation presumably allowed the 2D sheet to pack further in parallel fashion (Fig.S2) displaying $\pi-\pi$ interactions ( $3.96 \AA$ ).

Fig.S2. Crystal structure illustration of TMBTA.DIBUA; A) 2-D hydrogen bonded sheet of the anionic species; B) parallel packing of the 2-D layered structures displaying $\pi-\pi$ stacking.

TEBTA.DIBUA. The FT-IR of the salt TEBTA.DIBUA showed two characteristics bands at 1695 and $1566 \mathrm{~cm}^{-1}$ indicating the presence of both the COOH and $\mathrm{COO}^{-}$in the as synthesized salt. The single crystals were harvested from ethanol and it crystallized in the centrosymmetric monoclinic space group $\mathrm{P} 2_{1} / \mathrm{c}$. The asymmetric unit contained two TEBTA anions and two diisobutyl ammonium cations (DIBUA). The C-O bond distances [1.302(4)-1.304(4) $\AA, 1.196(4)-1.195(4) \AA$ and $1.311(4)-1.312(4) \AA$, $1.212(4)-1.217(4) \AA$ for $\mathrm{COOH} ; 1.273(4)-1.277(4) \AA, 1.220(4)-1.233(4) \AA$ for $\mathrm{COO}-]$ present in the crystal structure confirmed the presence monoanionic nature of the acid moieties. The carboxymethyl arms adopted syn-syn-syn conformation. The torsion angles involving the carboxymethyl arms and the aromatic
ring were 90.9-91.7, 94.5-94.7 and 95.2-97. $1^{\circ}$, respectively. The two carboxylic acid protons adopted syn and anti conformation. In the crystal structure, the monoanionic acid moiety was found to be a 2 D sheet like architecture sustained by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}\left[\mathrm{O} \cdots \mathrm{O}=2.545(3)-2.637(3) \AA\right.$ and $\left.\angle \mathrm{O}-\mathrm{H} \cdots \mathrm{O}=168.5-174.5^{\circ}\right]$ interactions. DIBUA cations were intercalated between the space formed by the two adjacent 2D sheet and was engaged in the hydrogen bonding interactions with the $\mathrm{COO}^{-}$and COOH functionality of the same acid moiety involving $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}\left[\mathrm{O} \cdots \mathrm{N}=2.769(4)-2.796(4) \AA\right.$ and $\left.\angle \mathrm{N}-\mathrm{H} \cdots \cdots \mathrm{O}=150.2-172.2^{\circ}\right]$ interactions. The overall packing did not show any $\pi-\pi$ interaction as syn-syn-syn conformation of the ethyl groups prevented the $\pi-\pi$ stacking interactions (Fig.S3).

Fig.S3. Crystal structure illustration of TEBTA.DIBUA; A) 2-D hydrogen bonded sheet involving the anionic species; B) parallel packing of the 2-D layered structures.

TMBTA.DAA. Two characteristics FT-IR band at 1732 and $1556 \mathrm{~cm}^{-1}$ were indicative of the presence both the COOH and $\mathrm{COO}^{-}$in the salt TMBTA.DAA. Crystals suitable for the single crystal X-ray diffraction were grown from methanol and it crystallized in the centrosymmetric monoclinic space group $\mathrm{P} 2_{1} / \mathrm{c}$. The asymmetric unit contained one TMBTA anion and one disordered diallyl ammonium (DAA)
cation. The C-O distances [1.209(4)-1.326(3) $\AA$ and $1.235(3)-1.317(3) \AA$ for the COOH and $1.223(4)-$ $1.287(3) \AA$ for the $\left.\mathrm{COO}^{-}\right]$present in the crystal structure supported the fact that the tripodal scaffold contained two COOH and one $\mathrm{COO}^{-}$groups in the crystalline solid. The three carboxymethyl arms were found to be adopted syn-syn-syn conformation. The torsion angles associated with the $\mathrm{COOH} / \mathrm{COO}^{-}$and the phenyl plane were calculated to be $91.2,92.0$ and $95.7^{\circ}$ respectively. The two COOH protons were found to be in syn and anti. The monoanionic acid moiety was found to be self assembled in the crystal lattice via $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}\left[\mathrm{O} \cdots \mathrm{O}=2.539(3)-2.622(3) \AA ; \angle \mathrm{O}-\mathrm{H} \cdots \mathrm{O}=172.8-173.6^{\circ}\right]$ interactions involving COOH and $\mathrm{COO}^{-}$resulting into a 2D sheet structure. The DAA cations were found to be occupied in the interstitial space between the parallel packed 2D sheets sustained by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}[\mathrm{N} \cdots \cdots \mathrm{O}=2.735(4)-2.815$ (3) $\left.\AA ; \angle \mathrm{N}-\mathrm{H} \cdots \mathrm{O}=166.9-179.4^{\circ}\right]$ interactions with the COOH and $\mathrm{COO}^{-}$of the acid moiety. Parallel packing of the 2 D sheets were also found to be sustained by the $\pi-\pi(4.0 \AA)$ stacking interactions (Fig.S4).

Fig.S4. Crystal structure illustration of TMBTA.DAA; A) 2-D hydrogen bonded sheet involving the anions; B) parallel packing of the layered structures. Carbon atoms of the disordered DAA cations.

TEBTA.DAA. FT-IR of the salt TEBTA.DAA showed two characteristics bands at $1716,1570 \mathrm{~cm}^{-1}$ indicating of the existence of both the COOH and $\mathrm{COO}^{-}$. The crystals suitable for the single crystal X-ray diffraction were grown from methanol-isopropanol mixture and were found to be crystallised in the noncentrosymmetric orthorhombic space group $\mathrm{Pca}_{2}$. The asymmetric unit contained two TEBTA anions and two disordered diallyl ammonium (DAA) cations. The C-O distances [1.317(5)-1.331(5), 1.204(5)$1.205(6) \AA$ and $1.314(5)-1.319(6), 1.216(6)-1.220(6) \AA$ for the COOH and $1.288(5)-1.294(5), 1.215(6)-$ $1.225(5) \AA$ for the $\left.\mathrm{COO}^{-}\right]$present in the crystal structure supported the monoanionic nature of the carboxylic moiety. In the monoanionic species, the carboxymethyl arms displayed syn-syn-syn conformation and were oriented opposite to the ethyl group. The torsion angles involving the $\mathrm{COOH} / \mathrm{COO}^{-}$ and the $\pi$-plane were calculated to be $91.6-92.0,92.4-93.2$ and $94.9-96.7^{\circ}$ respectively. The COOH groups in each monoanioic species adopted syn and anti conformation. The monoanionic tripodal acid moieties were self-assembled into a 2D sheet structure sustained by $\mathrm{O}-\mathrm{H} \cdot \cdots \mathrm{O}[\mathrm{O} \cdot \mathrm{O}=2.478(4)-2.620(4) \AA, \angle \mathrm{O}-$ $\mathrm{H} \cdots \mathrm{O}=165.5-174.5^{\circ}$ ] interactions involving COOH and $\mathrm{COO}^{-}$. The DAA cation was found to be occupying the interstitial space between the parallely packed 2D sheets involving $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}[\mathrm{N} \cdots \mathrm{O}=$ $\left.2.711(5)-3.076(5) \AA, \angle \mathrm{N}-\mathrm{H} \cdot \cdots \mathrm{O}=120.0-174.2^{\circ}\right]$ interactions. Understandably because of the syn-synsyn conformation of the ethyl groups, the 2 D sheets could not get involved in $\pi-\pi$ stacking interactions (Fig.S5).

Fig.S5. Crystal structure illustration of TEBTA.DAA; A) 2-D hydrogen bonded sheet of the anions; B) parallel packing of the layered structures; carbon atoms of the disordered DAA cation.

TMBTA.DSBUA. Two characteristic FT-IR bands at 1716 and $1626 \mathrm{~cm}^{-1}$ confirmed the presence of both COOH and $\mathrm{COO}^{-}$in the salt TMBTA.DSBUA. The single crystals were grown from ethanol and it crystallized in the non-centrosymmetric monoclinic space group $\mathrm{P}_{2}$. The asymmetric unit contained one TMBTA anion and disecondarybutyl ammonium (DSBUA) cation. The various C-O bond distances [1.205(4)-1.289(4) and 1.237(4)-1.287(4) $\AA$ for COOH and $1.236(4)-1.284(4) \AA$ for $\left.\mathrm{COO}^{-}\right]$also supported the incomplete deprotonation of all the acid moieties. Interestingly the carboxymethyl arms of the acid moiety adopted syn-syn-anti conformation. The torsion angles between the carboxymethyl arm and the phenyl plane were estimated to be $92.4,94.6$ and $102.2^{\circ}$ respectively. The two carboxylic protons were found to be in syn conformation. The crystal structure revealed that the monoanionic moiety formed a 2 D corrugated sheet structure sustained by $\mathrm{O}-\mathrm{H} \cdots \cdot \mathrm{O}[\mathrm{O} \cdots \mathrm{O}=3.187(4)-2.429(4) \AA$ and $\angle \mathrm{O}-\mathrm{H} \cdot \cdots \mathrm{O}=120(4)-$ $\left.159(5)^{\circ}\right]$ interactions. The DSBUA cations were located within the interstitial space of the parallel packing
of the corrugated sheets sustained by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}[\mathrm{O} \cdots \mathrm{N}=2.784(4)-2.792(4) \AA$ and $\angle \mathrm{N}-\mathrm{H} \cdots \mathrm{O}=154.5-$ $171.2^{\circ}$ ] interactions. (Fig.4A-B)
TEBTA.DSBUA. Characteristics FT-IR bands at 1716 and $1566 \mathrm{~cm}^{-1}$ in the salt TEBTA.DSBUA were attributed to the $v_{\mathrm{C}=0}$ of COOH and $\mathrm{COO}^{-}$respectively. The crystals suitable for single crystal X-ray diffraction were grown from ethanol; they were found to be crystallised in the monoclinic centrosymmetric space group $\mathrm{P} 2_{1} / \mathrm{c}$. The asymmetric unit contained two TEBTA anions, two disordered disecondarybutyl ammonium (DSBUA) cations and two solvent water molecules. The various C-O distances [1.209(5)$1.220(6), 1.309(6)-1.318(6) \AA$ and $1.215(5)-1.220(5), 1.288(5)-1.294(5) \AA$ for COOH and 1.189(6)$1.206(6), 1.265(6)-1.283(6) \AA$ for $\left.\mathrm{COO}^{-}\right]$supported incomplete deprotonation of all the COOH groups. The hydrogen atom of one of the COOH moiety could not be located in the difference fourier map. The three carboxymethyl arms were found to adopt syn-syn-syn conformation. The torsion angles involving the carboxymethyl arms and the phenyl plane were calculated to be $89.9-90.5,89.8-90.4$ and $93.9-94.5^{\circ}$, respectively. The COOH proton in each of the acid moieties were found to be adopting less frequently observed anti conformation. The monoanionic acid moiety was found to be self assembled via $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ $\left[\mathrm{O} \cdots \mathrm{O}=2.555(5)-2.573(4) \AA ; \angle \mathrm{O}-\mathrm{H} \cdots \mathrm{O}=171.6-173.7^{\circ}\right]$ interactions leading to the formation of a 2 D sheet like architecture in the crystal structure. DSBUA cations and the solvent water molecules were located between the two adjacent 2D sheets involving $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}[2.74-2.76 \AA]$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}[\mathrm{N} \cdots \mathrm{O}=$ $\left.2.845(7)-2.885(6) \AA ; \angle \mathrm{N}-\mathrm{H} \cdots \mathrm{O}=163-167^{\circ}\right]$ interactions, respectively. Because of the syn-syn-syn conformation of the three ethyl groups, no $\pi-\pi$ staking interaction could be observed although the 2 D sheets were packed in the parallel fashion (Fig.4C-D).
