### III. Ab-initio calculations for estimating the $\Delta H_f^0$ at 298K for CH<sub>3</sub>NO<sub>2</sub>

Ab-initio electronic structure calculations were performed using the Gaussian 03<sup>1</sup> suite of programs. Input structures were generated using CHEM3D, a part of the CHEMOFFICE<sup>2</sup> suite of programs. MOLEKEL<sup>3</sup> and gOPENMOL<sup>4</sup> were used to visualize the minima.  $\Delta H_f^0$  at 298K was computed using energetics at G3<sup>5</sup> and G3B3<sup>6</sup> levels of theory. We have adopted the use of atomization as well as a balanced isodesmic reactions (Reaction R1) using CH<sub>3</sub>NO, NO, NO<sub>2</sub>, N<sub>2</sub>O and N<sub>2</sub> as reference species to account for the incomplete cancellation of electron correlation energy when estimating heats of reaction ( $\Delta H_r$ ) and subsequently the heats of formation ( $\Delta H_f^0$ ).

Such isodesmic schemes<sup>7</sup> are known to obtain accurate  $\Delta H_f^0$  as long as the reference species have well characterized  $\Delta H_f^0$ .  $\Delta H_f^0$  for the reference species in R1 were taken from the Burcat and Ruscic compilations<sup>8</sup>. Heats of formation were calculated using the procedure outlined by Notario et al.<sup>9</sup>. The lowest frequency mode (23 cm<sup>-1</sup> at B3LYP/6-31G(d) and 20 cm<sup>-1</sup> at HF/6-31G(d) levels of theory) in CH<sub>3</sub>NO<sub>2</sub> was treated as a free rotor when calculating the contributions to the integrated heat capacity H(T)-H(0).
