

Horizontal shift factors (a_T) used for the superposition of dynamic curves regarding the two hexagonal phases: 45 wt% STDC (squares) and 45 wt% $C_{12}E_6$ (circles). As can be seen, the superposition over the two temperature intervals, 25-30°C (opened symbols) and 10-20°C (closed symbols), exhibits a simple Arrhenius behaviour ($\ln a_T \sim 1/T$).
