

Figure 1S SERS of Maltose thin film on electrochemically roughened Au electrode. Excitation 632.8 nm, the feature marked * does not appear in the solution or solid Raman spectrum of maltose.

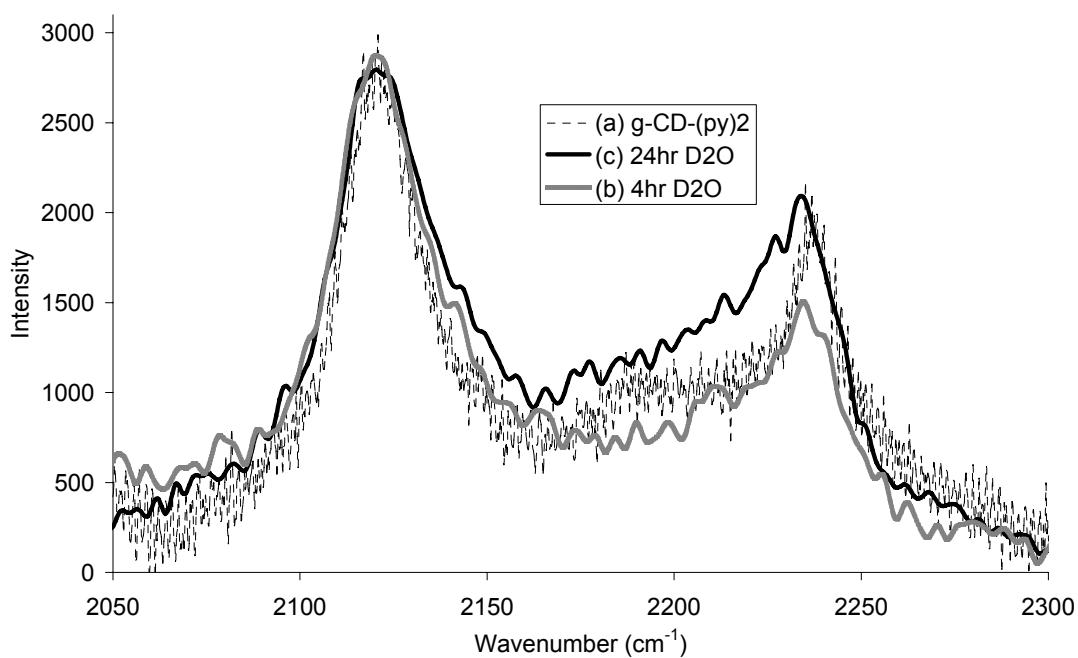

Figure 2S SERS of (a) γ -CD-(Py)₂ after 24 hr formation (on electrochemically roughened Au electrode. (b) γ -CD-(Py)₂ monolayer after 4 hr exposure to D₂O and (c) 24 hr exposure to D₂O. Excitation 632.8 nm

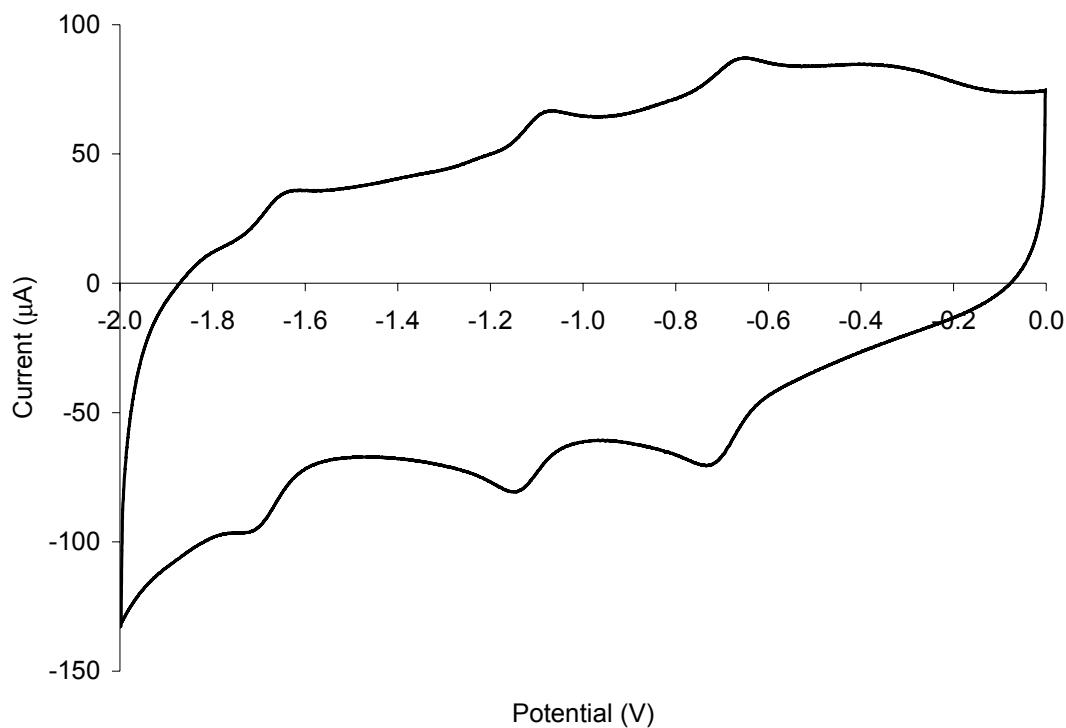

Figure 3S Cyclic voltammetry of solution phase $[\gamma\text{-CD}]_2\text{:C}_{60}$ in DMF, with 0.2 M LiClO_4 electrolyte, glassy carbon working electrode, Ag/Ag^+ reference and Pt wire auxillary electrode. Scan rate = 0.5 V/s.

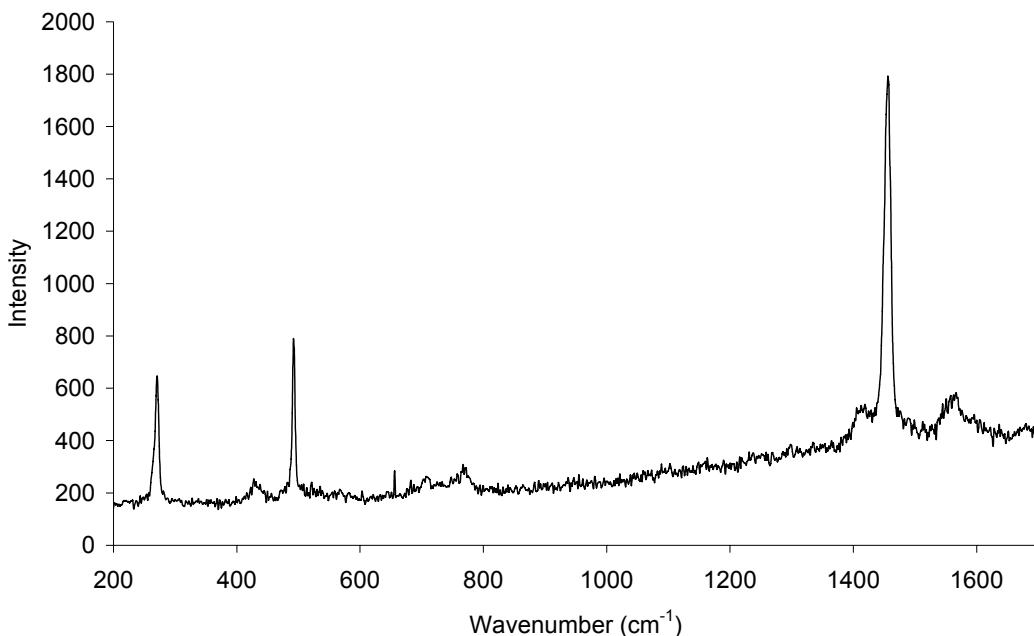

Figure 4S Raman of C₆₀ solid showing photopolymerisation using 488 nm excitation

	Layer (cm ⁻¹)	Bilayer (Backfilled γ -CD-(py) ₂) (cm ⁻¹)	Layer containing C ₆₀ (cm ⁻¹)
