**Figure S1.** Optimized structures for the most representative dinuclear species.

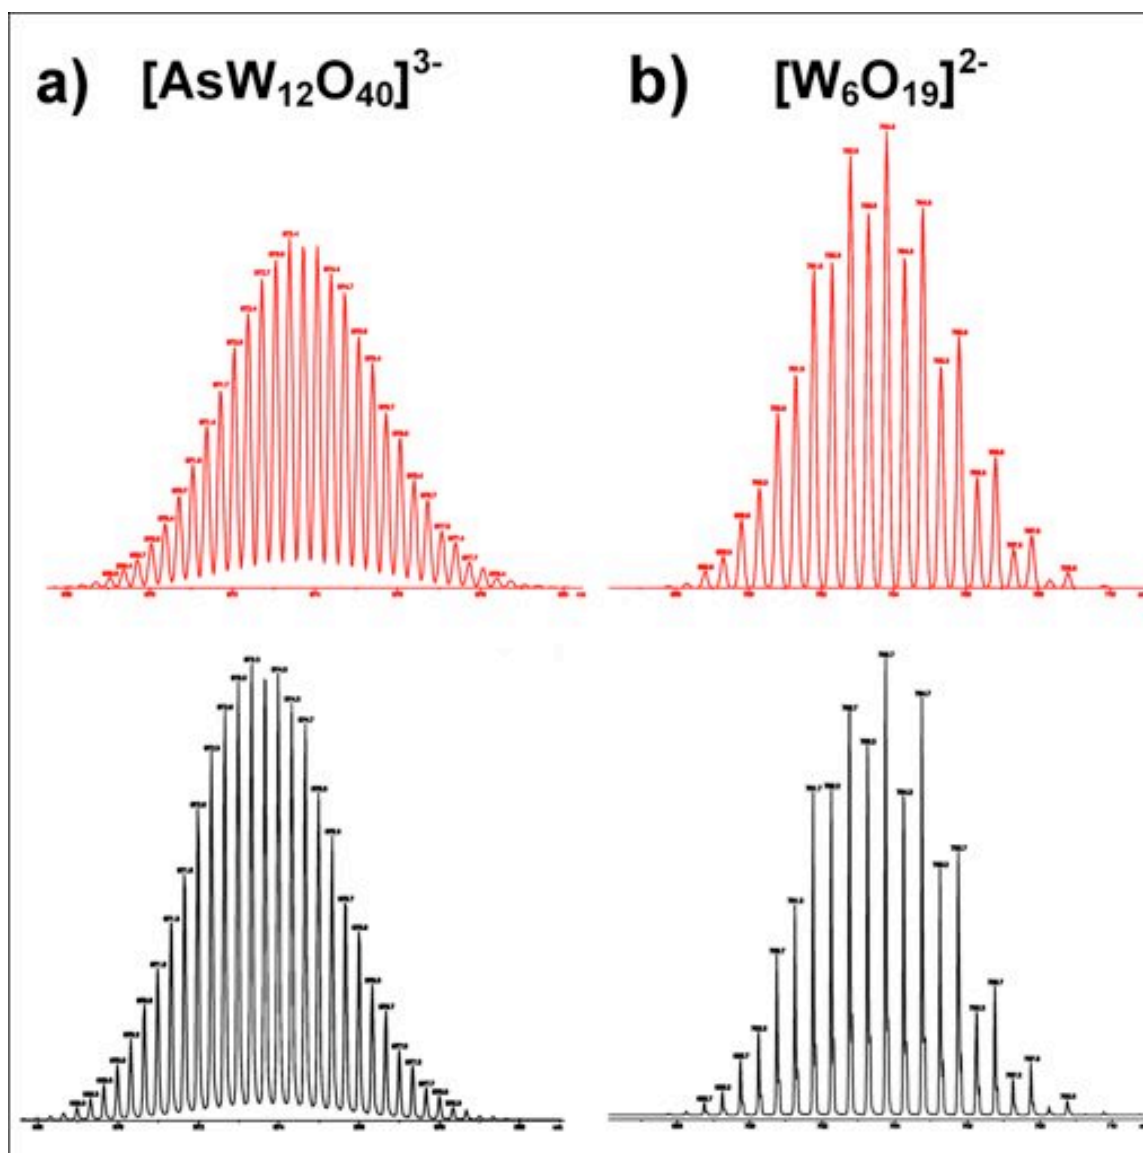

**Figure S2.** Monomeric fragments [WO<sub>3</sub>(OH)]<sup>-</sup> (*m/z* 248.9) and Na[WO<sub>4</sub>]<sup>-</sup> (*m/z* 270.9) observed in the assembly solution of [(*n*-C<sub>4</sub>H<sub>9</sub>)<sub>4</sub>N]<sub>3</sub>AsW<sub>12</sub>O<sub>40</sub> in the Mass Spectrometer.

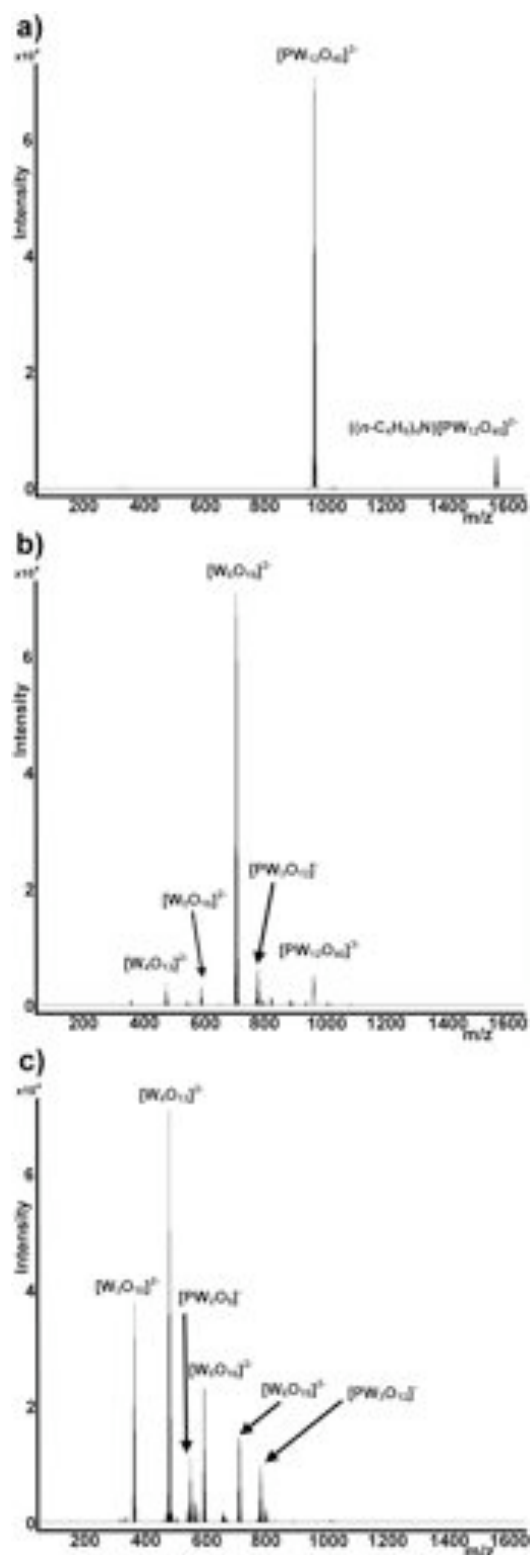

**Figure S3.** Isodimeric fragment Na[Mo<sub>2</sub>O<sub>7</sub>]<sup>-</sup> (*m/z* 326.8) observed in the assembly solution of [(*n*-C<sub>4</sub>H<sub>9</sub>)<sub>4</sub>N]<sub>3</sub>PMo<sub>12</sub>O<sub>40</sub> in the Mass Spectrometer.

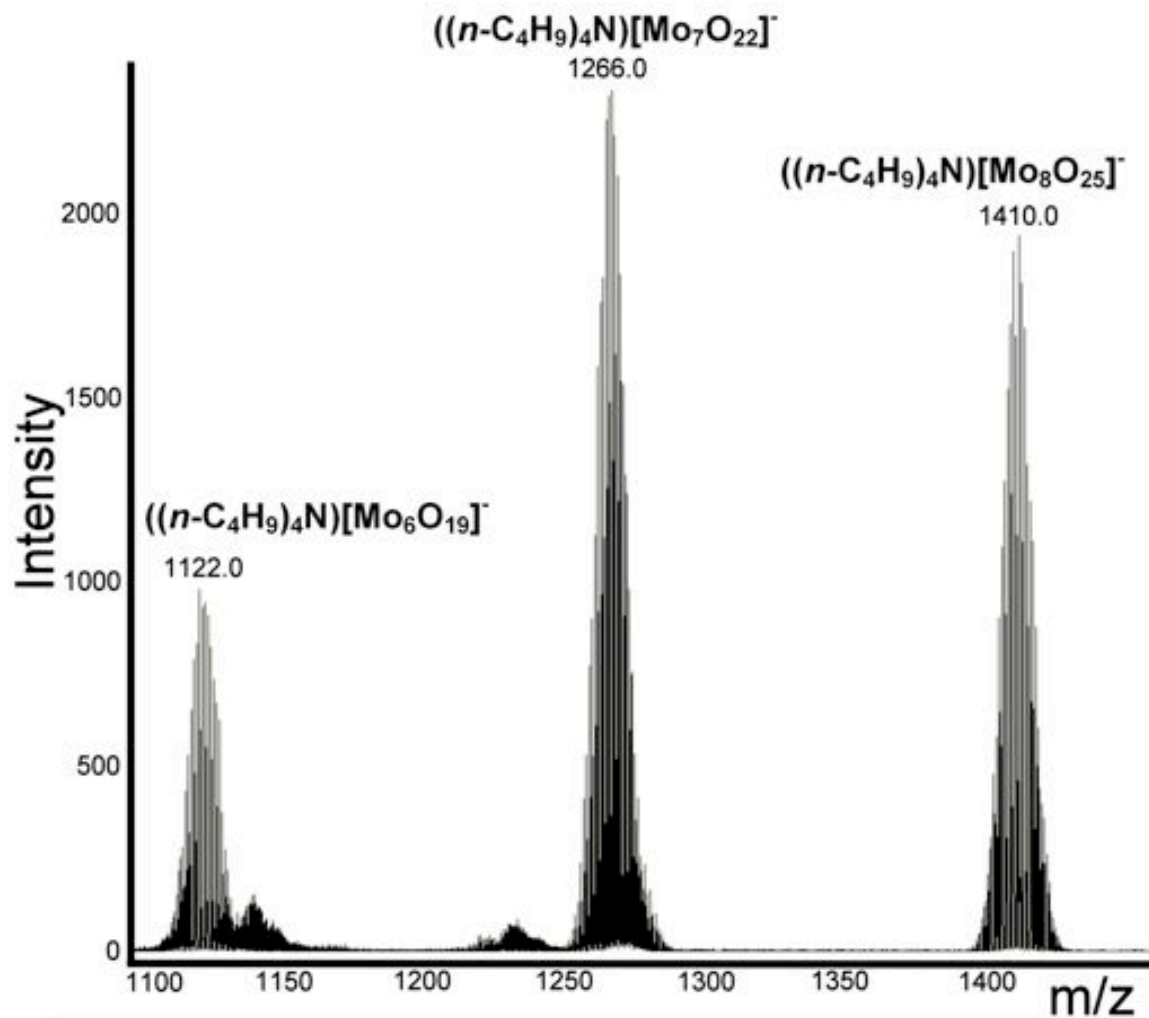

**Figure S4.** Protonated isodimeric fragment [Mo<sub>2</sub>O<sub>6</sub>(OH)]<sup>-</sup> (*m/z* 304.8) observed in the assembly solution of [(*n*-C<sub>4</sub>H<sub>9</sub>)<sub>4</sub>N]<sub>3</sub>PMo<sub>12</sub>O<sub>40</sub> in the Mass Spectrometer.

**Figure S5.** Comparison of experimental (top, red) and theoretical (bottom, black) mass spectra for (a)  $[\text{AsW}_{12}\text{O}_{40}]^{3-}$  ( $m/z$  973.3); and (b)  $[\text{W}_6\text{O}_{19}]^{2-}$  ( $m/z$  703.8). The experimental (red) isotope patterns shown above for the ion assigned peaks were generated from  $[(n\text{-C}_4\text{H}_9)_4\text{N}]_3\text{AsW}_{12}\text{O}_{40}$  dissolved in acetonitrile solution and studied by ESI-MS.

**Figure S6.** Electrospray Ionisation Mass Spectrometry data showing the collision induced dissociation (CID) of  $[(n\text{-C}_4\text{H}_9)_4\text{N}]_3\text{PW}_{12}\text{O}_{40}$  in acetonitrile showing the major ions observed in the gas phase at collision energies (CE) a) 5 eV; b) 25 eV; c) 45 eV respectively.

**Figure S7.** Electrospray Ionisation Mass Spectrometry data of collision induced dissociation (CID) of  $[(n-C_4H_9)_4N]_3AsMo_{12}O_{40}$  in acetonitrile showing the presence of key ions in the gas phase  $((n-C_4H_9)_4N)[Mo_6O_{19}]^-$  ( $m/z$  1122.0);  $((n-C_4H_9)_4N)[Mo_7O_{22}]^-$  ( $m/z$  1266.0) and  $((n-C_4H_9)_4N)[Mo_8O_{25}]^-$  ( $m/z$  1410.0).

**Figure S8.** Electrospray Ionisation Mass Spectrometry data of collision induced dissociation (CID) of  $[(n\text{-C}_4\text{H}_9)_4\text{N}]_3\text{PW}_{12}\text{O}_{40}$  in acetonitrile showing the presence of key doubly charged ions in the gas phase:  $[\text{W}_3\text{O}_{10}]^{2-}$  ( $m/z$  355.9);  $[\text{W}_4\text{O}_{13}]^{2-}$  ( $m/z$  471.9);  $[\text{W}_5\text{O}_{16}]^{2-}$  ( $m/z$  587.8) and  $[\text{W}_6\text{O}_{19}]^{2-}$  ( $m/z$  703.8)

**Figure S9.** Heterotetrameric fragment  $[\text{AsW}_3\text{O}_{11}(\text{OH})_2]^-$  ( $m/z$  836.7) observed in the fragmentation of  $[(n\text{-C}_4\text{H}_9)_4\text{N}]_3\text{AsW}_{12}\text{O}_{40}$  in acetonitrile.

**Table S2.** A summary of the common fragments observed in the assembly and fragmentation of Keggin anions,  $[\text{XM}_{12}\text{O}_{40}]^{3-}$  ( $\text{X} = \text{P}, \text{As}$ ;  $\text{M} = \text{W}, \text{Mo}$ ), transferred to the gas phase by electrospray ionization and analysed in the Mass Spectrometer.

## Experimental Section:

### *Fragmentation experiments*

Tetra-*n*-butylammonium salts (TBA =  $[(n\text{-C}_4\text{H}_9)_4\text{N}]$ ) of these Keggin anions were prepared by the following method: 1 mol of the relevant Keggin anion was dissolved in water and to it added 10 mol of Tetra-*n*-butylammonium bromide (TBABr). The resulting precipitate was allowed to stir for 10 min and subsequently filtered by Büchner filtration. The solid products were then washed twice by the following: water, ethanol and diethyl ether before being dried *in vacuo*. Purification of the TBA-Keggin salts was achieved by solubilizing small quantities of the TBA-salts in acetonitrile and setting up a diethyl ether vapour diffusion crystal growth method. Single crystals of the TBA-Keggin salts appear in the acetonitrile solution within several hours.

Elemental analysis (%) calcd. for  $((n\text{-C}_4\text{H}_9)_4\text{N})_3[\text{PMo}_{12}\text{O}_{40}]$ ,  $\text{C}_{48}\text{H}_{108}\text{Mo}_{12}\text{N}_3\text{O}_{40}\text{P}$  (2573.0 g mol<sup>-1</sup>): C 22.39, H 4.20, N 1.63; found (%):C 22.63, H 4.21, N 1.95. ### *Computational methodology*

COSMO methodology: To define the cavity that surrounds the molecules we use the solvent accessible surface (SAS) method and a fine tesserae. Once the geometry has been optimized using the SAS surface, we perform single-point calculations using the solvent excluding surface (SES) that yields more meaningful values for the hydration energies. Geometry optimization using the SES yields “unrealistic” distorted structures when the coordination number of W(VI) ions is lower than six. To obtain the electron density in solution, first it is converged in the gas phase and afterward the COSMO model is turned on to include the solvent effects variationally. The ionic radii of the atoms, which define the dimensions of the cavity surrounding the molecule, are chosen to be 1.26 Å for W, 0.64 for Mo, 1.52 for O, 1.00 for P, 0.56 for As and 1.20 for H.

Harmonic frequencies have been computed for most of the structures analyzed through this work: (i) All iso- and heterodinuclear species in Table S1 and Figure S1; (ii) All heterotrinuclear structures shown in Fig. 8 and most of the structures in Tables S4-S6 (those with energies highlighted in bold); (iii) All heterotetranuclear structures shown in Fig. 10 and many structures in Tables S7-S10 (those with energies highlighted in bold). In almost all the cases, the structures correspond to minima in the potential energy surface (all frequencies are positive). For some structures, one or few more imaginary frequencies with tiny values (absolute values smaller than 100 cm<sup>-1</sup>) are obtained. All these small imaginary frequencies, which are probably due to errors in the numerical calculation of the frequencies (these stationary points could be also considered as minima within the numerical error), correspond to modes in which the H atoms are involved. No displacements of the M or O atoms of the POM framework were detected.

No imaginary frequencies are found corresponding to modes that involve the M, X or O atoms. Since the number of computed structures is very large, we have decided to not incorporate them here. Anyone interested in these values can contact us and we will provide them.

Estimation of free energies from BP86/TZP/COSMO calculations: The reaction free energies have been computed within the harmonic approximation. Since the reaction takes place in solution, we have only considered the thermal and entropic vibrational contributions (translational and rotational contributions might probably be similar for reactants and products due to the large number of molecules in the condensed phase). As shown in Tables S11-S13, reaction free energies show the same trends as reaction energies, leading to the same main conclusions. In general, formation of products is somewhat more favoured when thermal and entropic effects are considered.

Metadynamics: The metadynamics simulations are based on the selection of collective variables (CV) that are suitable to describe the process. The parameters used in the metadynamics are the following: (i) for the dinuclear system ( $[\text{WO}_3(\text{OH})]^-$ ,  $[\text{PO}_2(\text{OH})_2]^-$ , 27  $\text{H}_2\text{O}$ )  $k = 1.0$  a.u.,  $M = 20.0$  a.m.u. The height of the hills ( $W$ ) is  $0.063$   $\text{kcal}\cdot\text{mol}^{-1}$ , their perpendicular width ( $\Delta s^\perp$ )  $0.04$ , and the deposition rate ( $\Delta t$ )  $0.0144$  ps. The total simulation time ( $t_{\text{total}}$ ) was  $20$  ps; (ii) Same parameters as previous metadynamics, but  $W = 0.31$   $\text{kcal}\cdot\text{mol}^{-1}$ ; (iii) CV:  $W\cdots\text{O}$  distance (O from the phosphate group),  $k = 1.0$  a.u.,  $M = 10.0$  a.m.u.,  $W = 0.063$   $\text{kcal}\cdot\text{mol}^{-1}$ ,  $\Delta s^\perp = 0.08$ ,  $\Delta t = 0.0144$  ps,  $t_{\text{total}} = 33$  ps; (iv) for the heterotrimeric system ( $[\text{W}_2\text{O}_6(\text{OH})]^-$ ,  $[\text{PO}_2(\text{OH})_2]^-$ , 58  $\text{H}_2\text{O}$ )  $k = 1.5$  a.u.,  $M = 40.0$  a.m.u.,  $W = 0.13$   $\text{kcal}\cdot\text{mol}^{-1}$ ,  $\Delta s^\perp = 0.03$ ,  $\Delta t = 0.0144$  ps,  $t_{\text{total}} = 30$  ps; (v) for the isotrimeric system ( $[\text{W}_2\text{O}_6(\text{OH})]^-$ ,  $[\text{WO}_3(\text{OH})]^-$ , 58  $\text{H}_2\text{O}$ ) two CVs were used: 1) the coordination number of W from the dimer with respect to the O atoms of the monomer; and 2) the coordination number of W from the monomer with respect to the O atoms of the dimer;  $k_1 = k_2 = 1.5$  a.u.,  $M_1 = M_2 = 40.0$  a.m.u.,  $W = 0.31$   $\text{kcal}\cdot\text{mol}^{-1}$ ,  $\Delta s^\perp = 0.04$ ,  $\Delta t = 0.0144$  ps,  $t_{\text{total}} = 70$  ps. The free energy for the first step of the reaction (step 1, Table 1) computed from the metadynamics run matches fairly well ( $-9$   $\text{kcal}\cdot\text{mol}^{-1}$ , ref. 11a) with the estimated value from static BP86/COSMO methodology ( $-8$   $\text{kcal}\cdot\text{mol}^{-1}$ ).
