### Dimer geometry

The following table gives the coordinates of the *trans* TF-Az-OMe dimer at a distance  $R = 7.8 \text{ \AA}$ , with monomer coordinates optimized for the  $S_0$  state on the B3LYP/6-31G\* level of theory.

Table 1: Cartesian coordinates of the TF-Az-OMe dimer at intermolecular distance of  $7.8 \text{ \AA}$ . The optimized structure of the monomers was used.

## Lowest-energy $\pi \rightarrow \pi^*$ transition

The lowest-energy  $\pi \rightarrow \pi^*$  transition in TF-Az-OMe is dominated by a HOMO $\rightarrow$  LUMO excitation. The frontier orbitals are schematically indicated in the following figure.

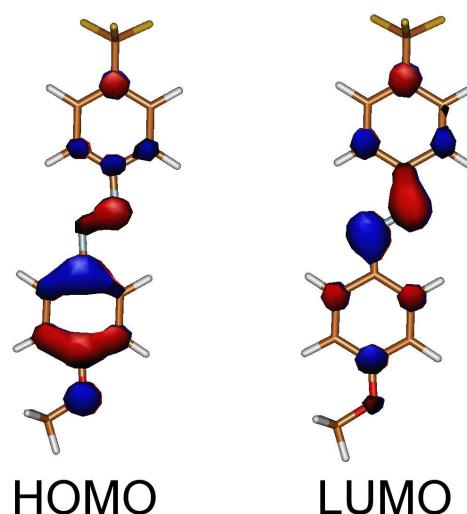

Figure 1: Kohn-Sham frontier orbitals HOMO and LUMO of the monomer (B3LYP/6-31G\*), which dominate the strongest  $\pi \rightarrow \pi^*$  transition according to TD-B3LYP/6-31G\*.

## TD-DFT calculations for the dimer

distance $R$ [Å]	transition	$\Delta E_{eg}$ [eV]	$\mu_{eg}$ [ea <sub>0</sub> ]	character

	$S_0 \rightarrow S_7$	3.492	2.12	mix. $\rightarrow \pi^*$
	$S_0 \rightarrow S_8$	3.554	2.43	mix. $\rightarrow \pi^*$
	$S_0 \rightarrow S_9$	3.671	1.70	$\pi \rightarrow \pi^*$
4.5	$S_0 \rightarrow S_8$	3.587	4.20	$\pi \rightarrow \pi^*$
5.0	$S_0 \rightarrow S_8$	3.581	4.38	$\pi \rightarrow \pi^*$
5.5	$S_0 \rightarrow S_8$	3.569	4.45	$\pi \rightarrow \pi^*$
6.0	$S_0 \rightarrow S_8$	3.557	4.50	$\pi \rightarrow \pi^*$
6.5	$S_0 \rightarrow S_7$	3.546	4.53	$\pi \rightarrow \pi^*$
7.0	$S_0 \rightarrow S_7$	3.537	4.56	$\pi \rightarrow \pi^*$
7.5	$S_0 \rightarrow S_7$	3.530	4.58	$\pi \rightarrow \pi^*$
8.0	$S_0 \rightarrow S_6$	3.523	4.61	$\pi \rightarrow \pi^*$
8.5	$S_0 \rightarrow S_6$	3.517	4.62	$\pi \rightarrow \pi^*$
9.0	$S_0 \rightarrow S_6$	3.513	4.64	$\pi \rightarrow \pi^*$
9.5	$S_0 \rightarrow S_6$	3.508	4.65	$\pi \rightarrow \pi^*$
10.0	$S_0 \rightarrow S_6$	3.505	4.66	$\pi \rightarrow \pi^*$
monomer	$S_0 \rightarrow S_2$	3.477	3.37	$\pi \rightarrow \pi^*$

Table 2: Excitation energies, transition dipole moments, and characters of the strongest transitions for different intermolecular distances in the dimer model, obtained with TD-B3LYP/6-31G\*. By “mix.” we indicate mixed  $n-$  and  $\pi$ -character.

## A simple, Hückel-type excitonic band model

If  $N = 2M + 1$  are placed along a chain with periodic boundary conditions, assuming that nearest neighbours (only) at distance  $R$  interact through a coupling matrix element  $\Delta^{(2)}$ , the single-exciton states form a band with energies given by Eq.(14), and corresponding single-exciton wavefunctions given by

$$\psi(k) = \frac{1}{\sqrt{N}} \sum_{n=-M}^{+M} e^{iknR} \Phi_n , \quad (1)$$

where  $|\Phi_n\rangle = |gg\cdots geg\cdots gg\rangle$  has an excitation ( $e$ ) at the  $n$ -th position of the chain. In the ground state  $\psi_G$ , which is assumed to be a dispersionless product state, all monomers are unexcited. The transition dipole matrix

elements for transitions from the ground state into the single-exciton band are

$$\underline{\mu}_G(k) = \langle \psi_G | \hat{\underline{\mu}} | \psi(k) \rangle \quad (2)$$

$$= \langle gg \cdots g | \sum_{m=-M}^{+M} \hat{\underline{\mu}}^{(m)} | \frac{1}{\sqrt{N}} \sum_{n=-M}^{+M} e^{iknR} gg \cdots geg \cdots gg \rangle \quad (3)$$

$$= \frac{1}{\sqrt{N}} \sum_{n=-M}^{+M} e^{iknR} \underline{\mu}_{eg}^{(n)} , \quad (4)$$

where  $\underline{\mu}_{eg}^{(n)}$  is the transition dipole of the  $n$ -th monomer. The strongest total transition dipole moment occurs for  $k = 0$  and is given by Eq.(15).
