

Table of contents

I- Introduction

II- Rayleigh and Brillouin light scattering. Landau-Paczek ratio.

III- Experimental

A-Samples

B-Technique

C-Experimental results

1-Dependence of Landau-Placzek ratio on the very low alkali halide concentration

2-Effect of aging

IV- Interpretation

A-Origin of the Landau-Placzek ratio in shaken aqueous solutions

1-Fluctuations of ion concentrations for $C > 2 \cdot 10^{-5} M$

2-Submicroscopic bubbles for $C < 2 \cdot 10^{-7} M$

B-Stability of the bubbles: role of the ions

1-Electrically charged bubbles and increase of their volume with the dilution

2-long bubble lifetime originating in electric interactions

V- Conclusion

Novelty of the work:

Very stable submicroscopic bubbles are detected by light scattering in highly diluted alkali halide aqueous solutions
