## 1 Additional Plots

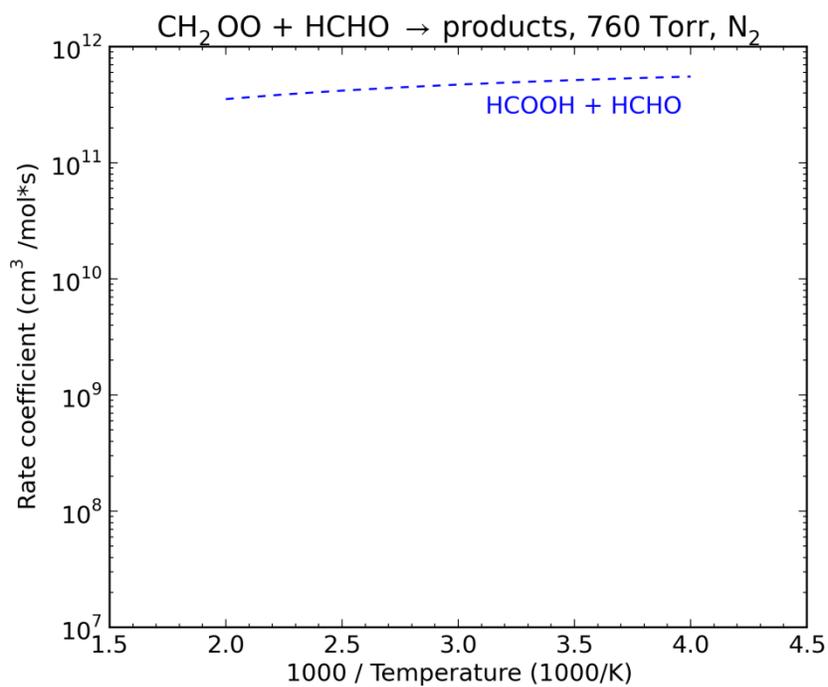

Figure 1: Predicted rate coefficients  $k(T, P)$  versus temperature for  $\bullet\text{CH}_2\text{OO}\bullet + \text{HCHO} \rightarrow$  products at 760 Torr  $\text{N}_2$ .

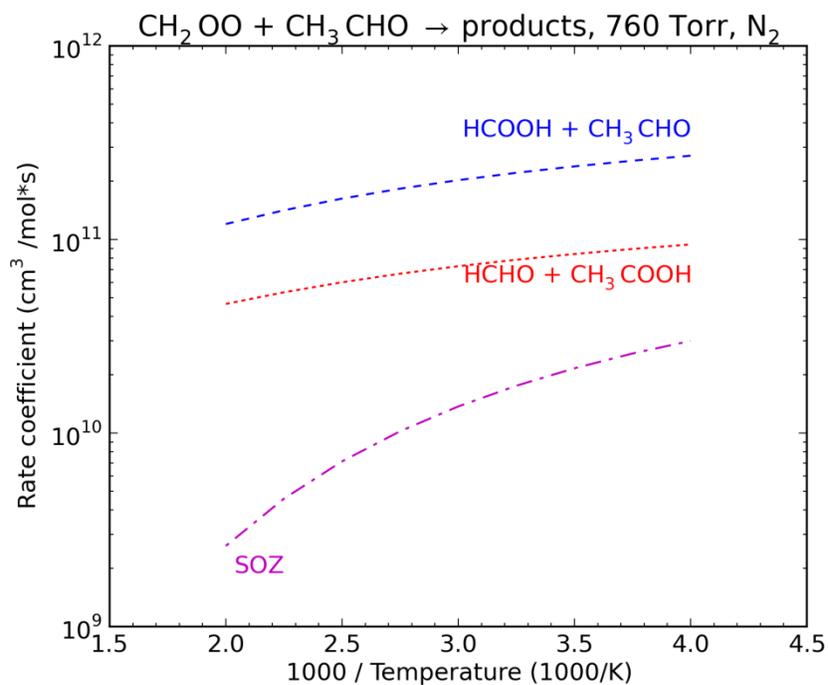

Figure 2: Predicted rate coefficients  $k(T, P)$  versus temperature for  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{CHO} \rightarrow$  products at 760 Torr  $\text{N}_2$ .

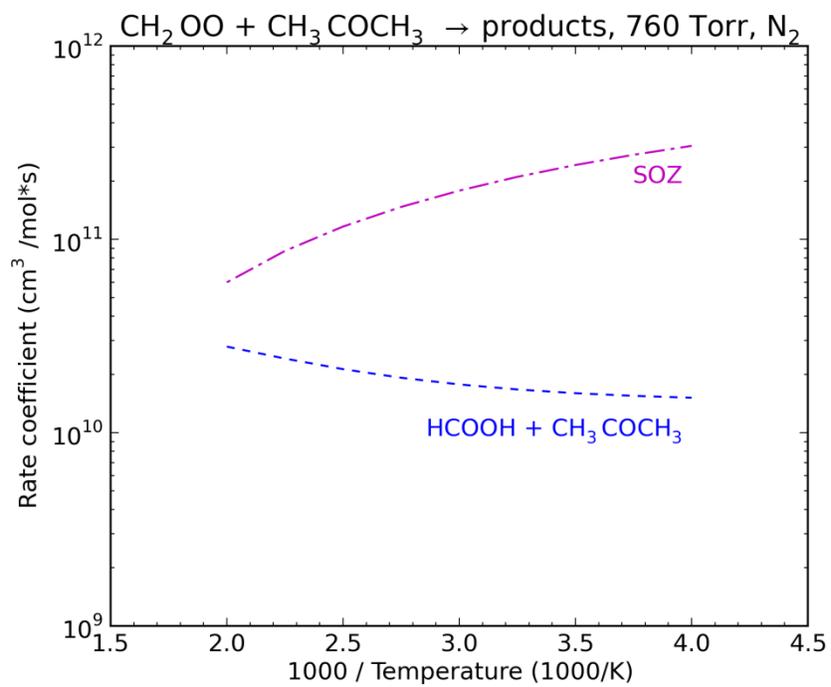

Figure 3: Predicted rate coefficients  $k(T, P)$  versus temperature for  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{COCH}_3 \rightarrow$  products at 760 Torr N<sub>2</sub>.

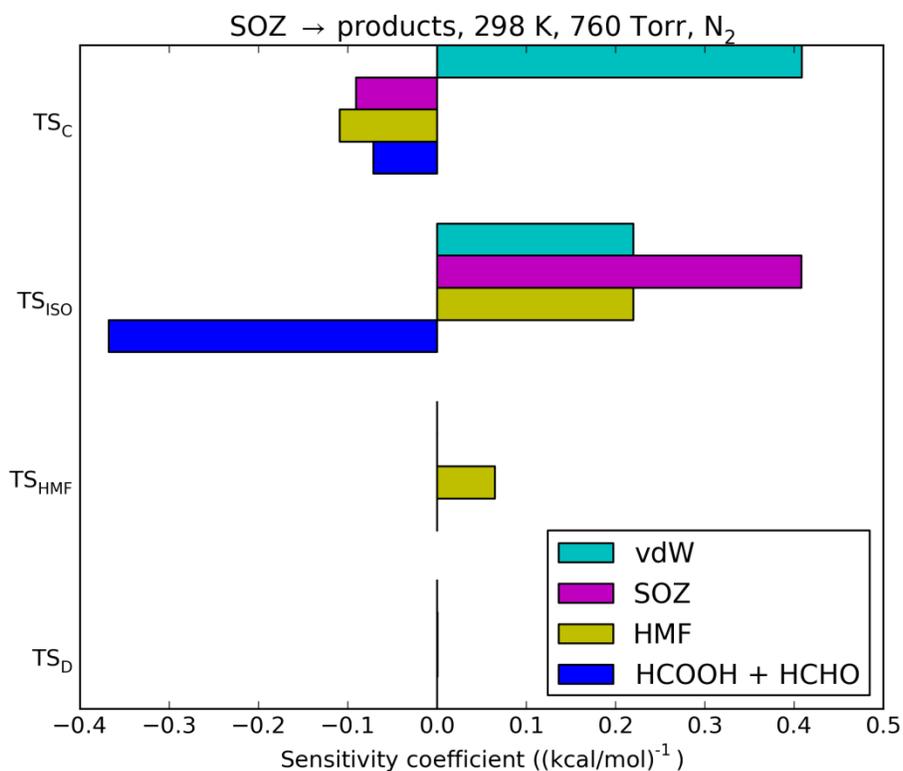

Figure 4: Normalized sensitivities coefficients,  $\frac{\partial \ln Y_i}{\partial E_j}$  of the product yields ( $Y_i$ ) to the transition state barrier heights ( $E_j$ ) for the  $\bullet\text{CH}_2\text{OO}\bullet + \text{HCHO}$  network at 298 K and 760 Torr, with nitrogen as the bath gas. Each cluster of bars corresponds to the transition state barrier height of one reaction, indicated at left. The bars indicate how each product's yield is affected by adjusting the associated barrier height, and are ordered and colored by product as shown in the legend.

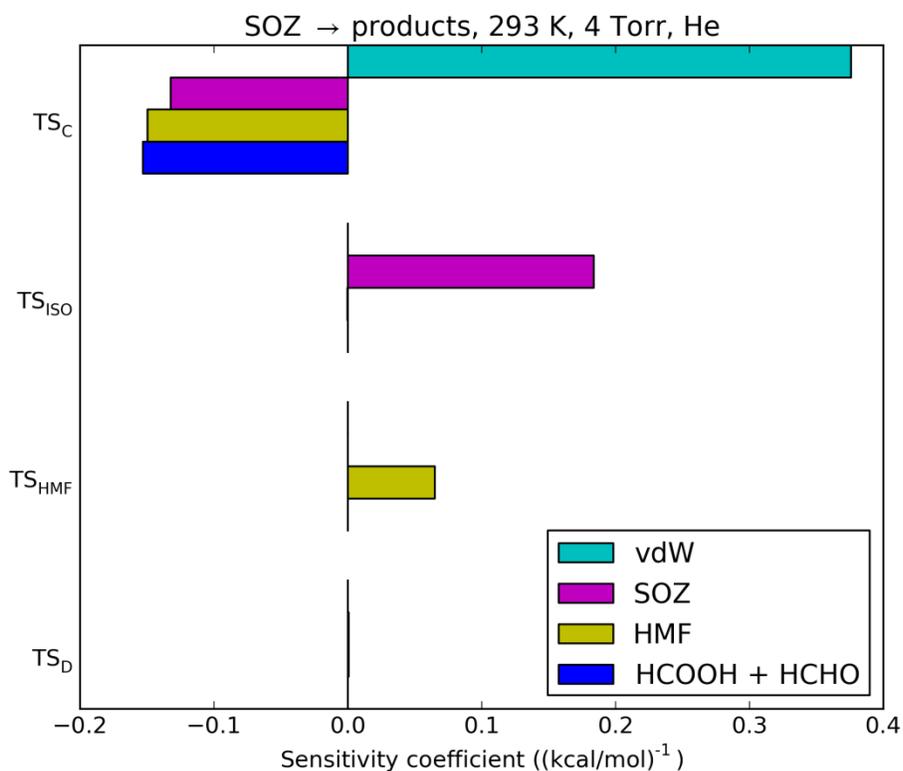

Figure 5: Normalized sensitivities coefficients,  $\frac{\partial \ln Y_i}{\partial E_j}$  of the product yields ( $Y_i$ ) to the transition state barrier heights ( $E_j$ ) for the  $\bullet\text{CH}_2\text{OO}\bullet + \text{HCHO}$  network at 293 K and 4 Torr, with helium as the bath gas. Each cluster of bars corresponds to the transition state barrier height of one reaction, indicated at left. The bars indicate how each product's yield is affected by adjusting the associated barrier height, and are ordered and colored by product as shown in the legend.

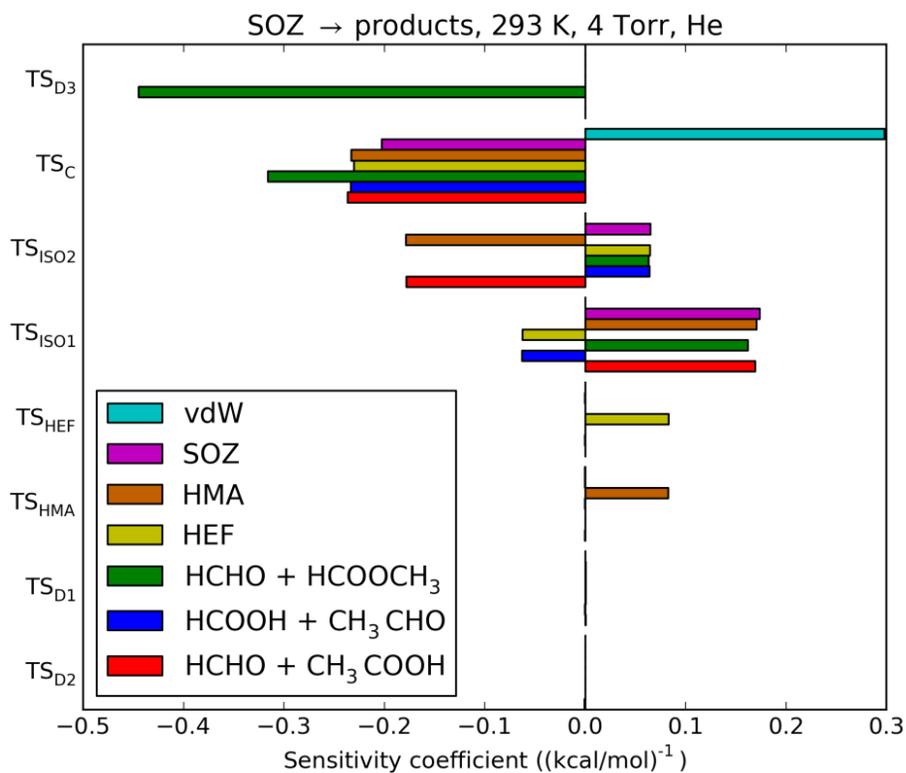

Figure 6: Normalized sensitivities coefficients,  $\frac{\partial \ln Y_i}{\partial E_j}$  of the product yields ( $Y_i$ ) to the transition state barrier heights ( $E_j$ ) for the  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{CHO}$  network at 293 K and 4 Torr, with helium as the bath gas. Each cluster of bars corresponds to the transition state barrier height of one reaction, indicated at left. The bars indicate how each product's yield is affected by adjusting the associated barrier height, and are ordered and colored by product as shown in the legend.

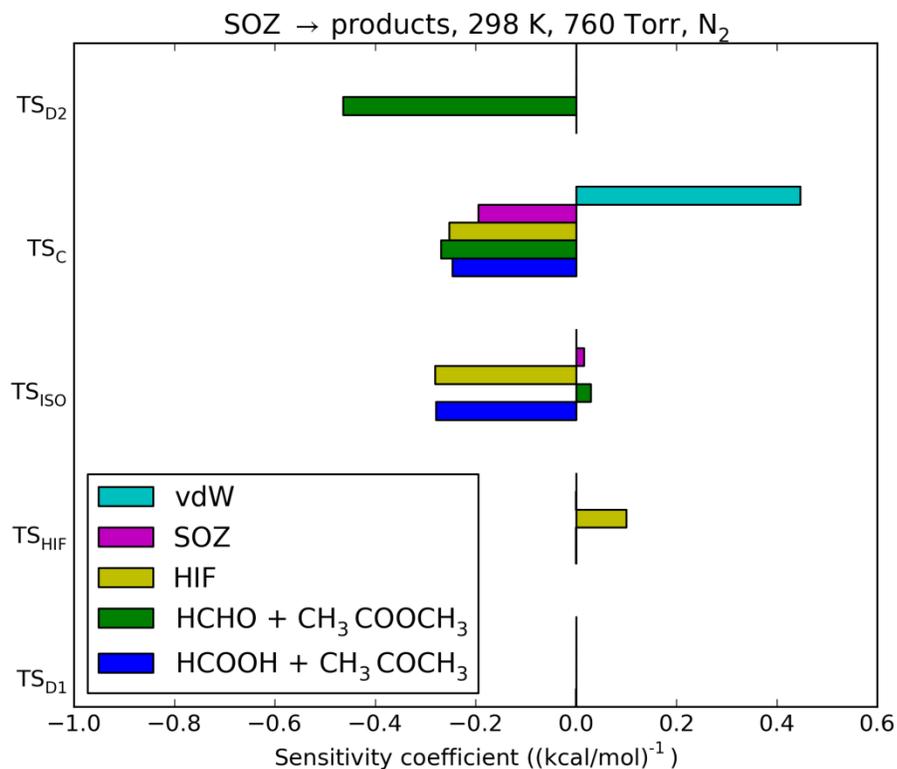

Figure 7: Normalized sensitivities coefficients,  $\frac{\partial \ln Y_i}{\partial E_j}$  of the product yields ( $Y_i$ ) to the transition state barrier heights ( $E_j$ ) for the  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{COCH}_3$  network at 298 K and 760 Torr, with nitrogen as the bath gas. Each cluster of bars corresponds to the transition state barrier height of one reaction, indicated at left. The bars indicate how each product's yield is affected by adjusting the associated barrier height, and are ordered and colored by product as shown in the legend.

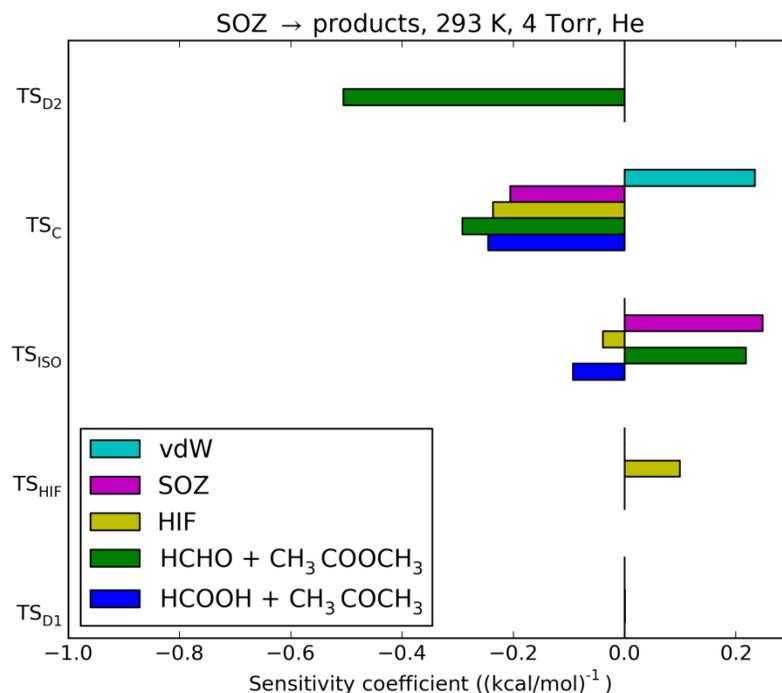

Figure 8: Normalized sensitivities coefficients,  $\frac{\partial \ln Y_i}{\partial E_j}$  of the product yields ( $Y_i$ ) to the transition state barrier heights ( $E_j$ ) for the  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{COCH}_3$  network at 293 K and 4 Torr, with helium as the bath gas. Each cluster of bars corresponds to the transition state barrier height of one reaction, indicated at left. The bars indicate how each product's yield is affected by adjusting the associated barrier height, and are ordered and colored by product as shown in the legend.

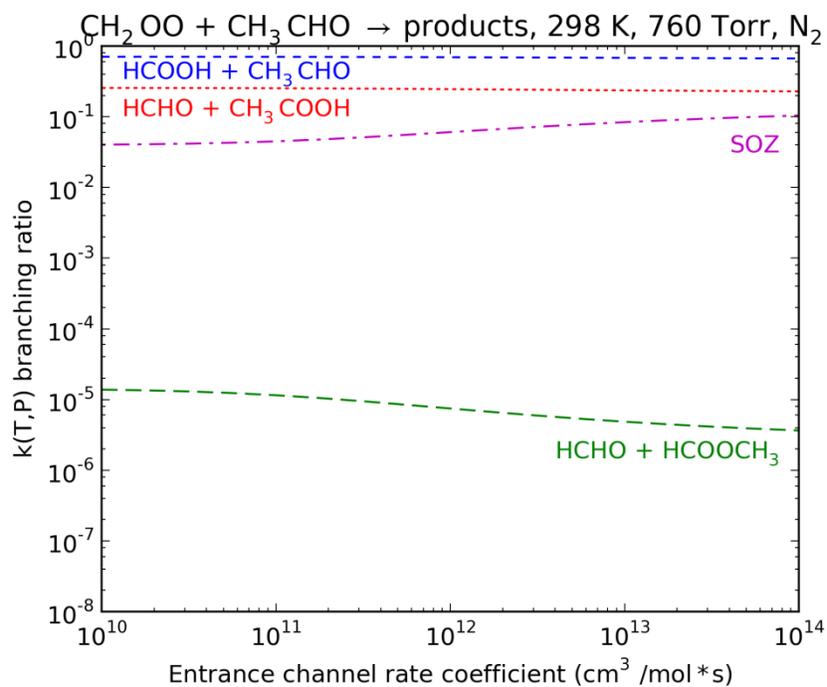

Figure 9: Effect of changing the rate of the adduct-forming entrance channel on the product branching ratios for  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{CHO} \rightarrow \text{products}$  at 298 K and 760 Torr N<sub>2</sub>.

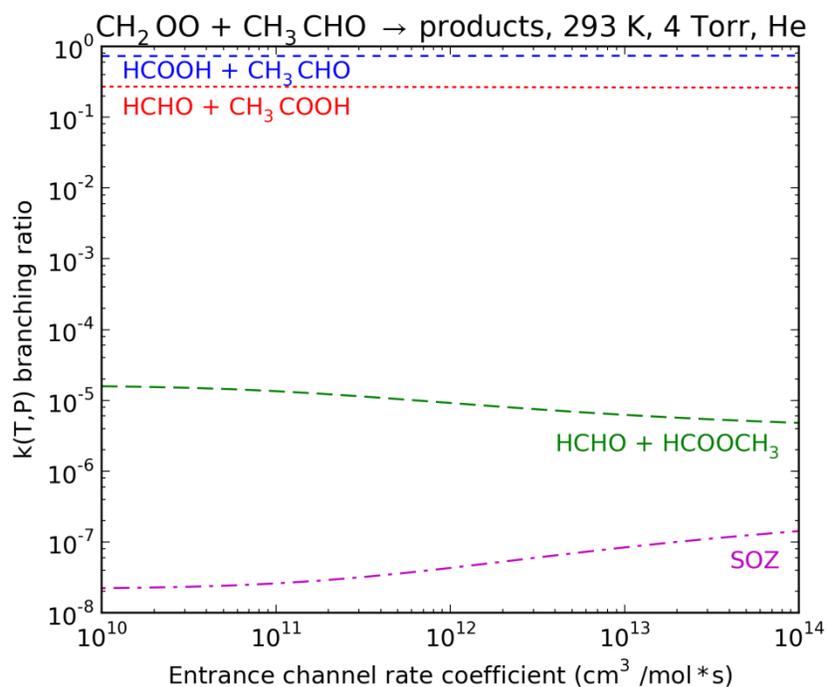

Figure 10: Effect of changing the rate of the adduct-forming entrance channel on the product branching ratios for  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{CHO} \rightarrow \text{products}$  at 293 K and 4 Torr He.

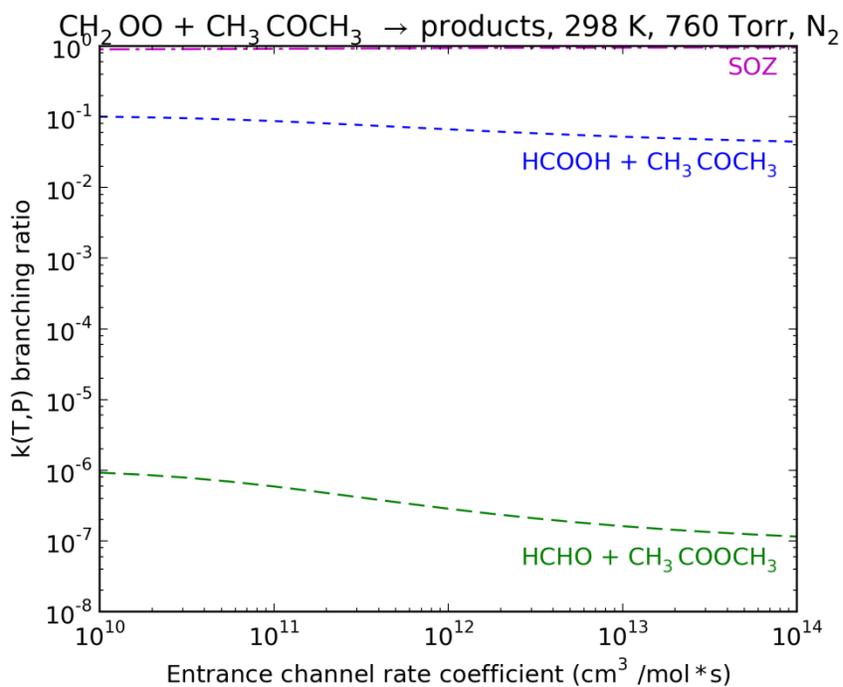

Figure 11: Effect of changing the rate of the adduct-forming entrance channel on the product branching ratios for  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{COCH}_3 \rightarrow \text{products}$  at 298 K and 760 Torr  $\text{N}_2$ .

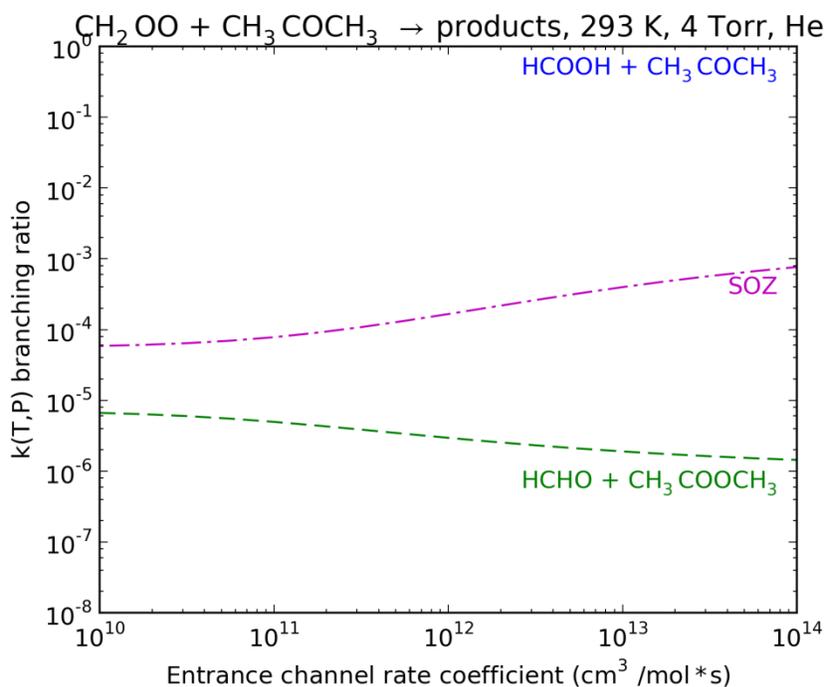

Figure 12: Effect of changing the rate of the adduct-forming entrance channel on the product branching ratios for  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{COCH}_3 \rightarrow \text{products}$  at 293 K and 4 Torr He.

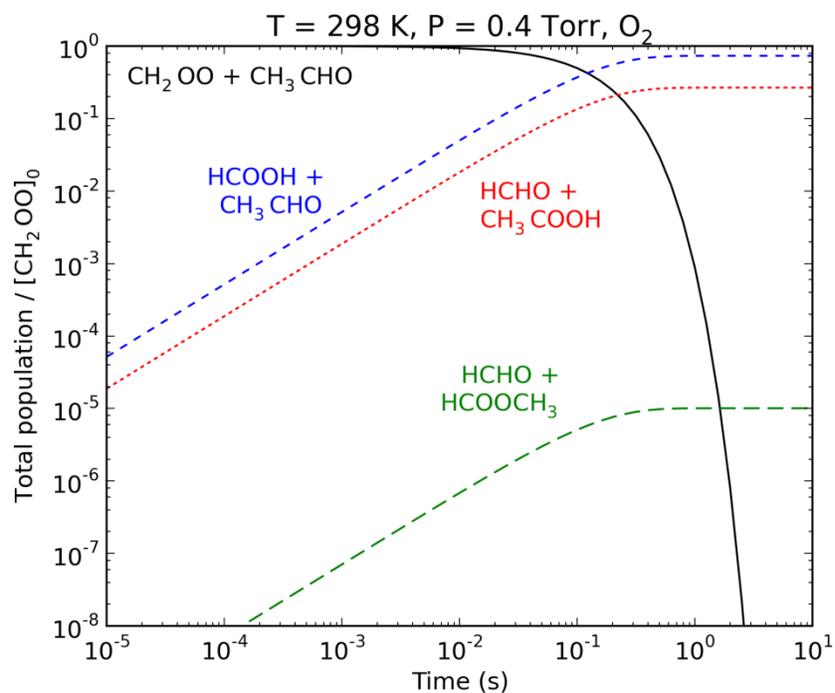

Figure 13: Predicted concentration profiles for the  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{CHO}$  network at 293 K and 0.4 Torr  $\text{O}_2$ , using a  $\text{CH}_3\text{COCH}_3$  mole fraction of 0.01. The yield of SOZ due to collisional stabilization by  $\text{O}_2$  is so low that the SOZ profile never appears on this plot, justifying the neglecting of  $\text{O}_2$  collisions.

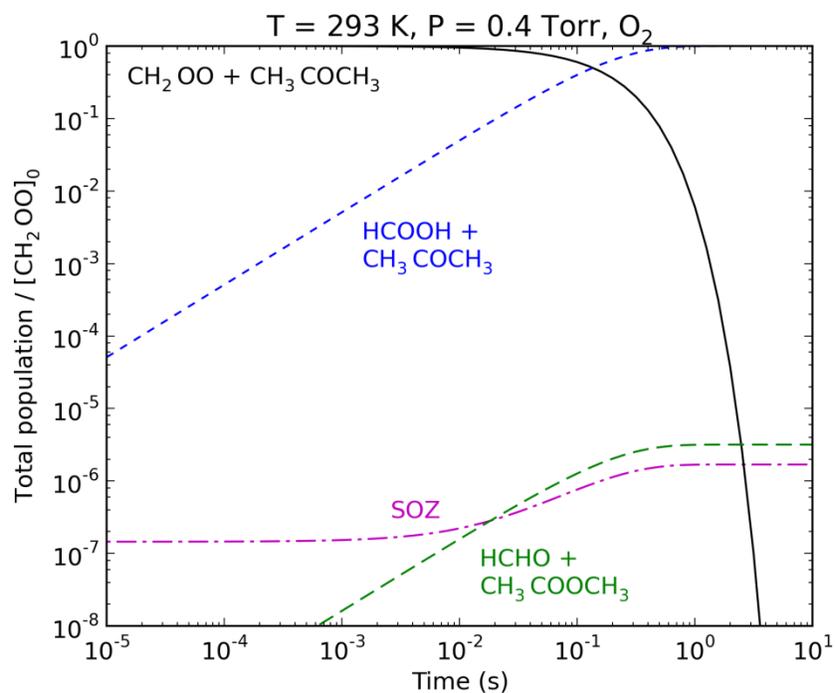

Figure 14: Predicted concentration profiles for the  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{COCH}_3$  network at 293 K and 0.4 Torr O<sub>2</sub>, using a CH<sub>3</sub>COCH<sub>3</sub> mole fraction of 0.01. The yield of SOZ due to collisional stabilization by O<sub>2</sub> is much lower than that due to the He in Taatjes' experiment, justifying the neglecting of O<sub>2</sub> collisions.

## 2 High-Pressure Limit Rate Coefficients

**Table 1: Arrhenius parameters corresponding to high-pressure limit rate coefficients for elementary reactions on the  $\bullet\text{CH}_2\text{OO}\bullet + \text{HCHO}$  PES<sup>a</sup>**

Reaction	$A$ (s <sup>-1</sup> )	$n$	$E_a$ (kcal/mol)
SOZ $\rightleftharpoons$ [ $\bullet\text{CH}_2\text{OO}\bullet + \text{HCHO}$ ]	$2.4 \times 10^{12}$	0.85	46.1
SOZ $\rightleftharpoons$ [HCOOH + HCHO]	$1.1 \times 10^9$	1.70	40.7
SOZ $\rightleftharpoons$ HMF	$6.7 \times 10^7$	1.97	26.9
HMF $\rightleftharpoons$ [HCOOH + HCHO]	$1.7 \times 10^{12}$	-0.03	19.1

<sup>a</sup>The rate coefficient is  $k(T) = A(T/1 \text{ [K]})^n \exp(-E_a/RT)$ .

**Table 2: Arrhenius parameters corresponding to high-pressure limit rate coefficients for elementary reactions on the  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{CHO}$  PES<sup>a</sup>**

Reaction	$A$ (s <sup>-1</sup> )	$n$	$E_a$ (kcal/mol)
SOZ $\rightleftharpoons$ [ $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{CHO}$ ]	$4.8 \times 10^{12}$	0.73	45.3
SOZ $\rightleftharpoons$ HEF	$1.1 \times 10^9$	1.64	28.0
SOZ $\rightleftharpoons$ HMA	$4.0 \times 10^8$	1.75	29.4
HEF $\rightleftharpoons$ [HCOOH + CH <sub>3</sub> CHO]	$1.9 \times 10^{14}$	-0.52	17.6
HMA $\rightleftharpoons$ [CH <sub>3</sub> COOH + HCHO]	$1.7 \times 10^{13}$	-0.24	18.9
SOZ $\rightleftharpoons$ [HCOOH + CH <sub>3</sub> CHO]	$2.7 \times 10^{10}$	1.33	39.5
SOZ $\rightleftharpoons$ [CH <sub>3</sub> COOH + HCHO]	$1.3 \times 10^8$	1.90	38.6
SOZ $\rightleftharpoons$ [HCOOCH <sub>3</sub> + HCHO]	$8.8 \times 10^{11}$	0.99	47.0

<sup>a</sup>The rate coefficient is  $k(T) = A(T/1 \text{ [K]})^n \exp(-E_a/RT)$ .

**Table 3: Arrhenius parameters corresponding to high-pressure limit rate coefficients for elementary reactions on the  $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{COCH}_3$  PES<sup>a</sup>**

Reaction	$A$ (s <sup>-1</sup> )	$n$	$E_a$ (kcal/mol)
SOZ $\rightleftharpoons$ [ $\bullet\text{CH}_2\text{OO}\bullet + \text{CH}_3\text{COCH}_3$ ]	$9.1 \times 10^{12}$	0.62	45.0
SOZ $\rightleftharpoons$ HIF	$3.2 \times 10^8$	1.81	30.2
HIF $\rightleftharpoons$ [HCOOH + CH <sub>3</sub> COCH <sub>3</sub> ]	$9.1 \times 10^{14}$	-0.73	15.6
SOZ $\rightleftharpoons$ [HCOOH + CH <sub>3</sub> COCH <sub>3</sub> ]	$9.4 \times 10^{10}$	1.18	40.9
SOZ $\rightleftharpoons$ [CH <sub>3</sub> COOCH <sub>3</sub> + HCHO]	$6.2 \times 10^{11}$	0.62	45.0

<sup>a</sup>The rate coefficient is  $k(T) = A(T/1 \text{ [K]})^n \exp(-E_a/RT)$ .
