## 1. General characterization

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were measured on a Bruker Avance-400 spectrometer. Absorption spectra were recorded on a Shimadzu UV-1800 spectrophotometer. Gel permeation chromatography (GPC) measurements were performed on a Waters 1515 series GPC coupled with UV-vis detector using tetrahydrofuran as eluent and polystyrenes as standards. Thermogravimetric analysis was measured by a Perkin-Elmer Diamond TG/DTA thermal analyzer. Cyclic voltammetry was conducted on a Shanghai Chenhua CHI620 voltammetric analyzer under argon in an anhydrous acetonitrile solution of tetra-n-butylammonium hexafluorophosphate ( 0.1 M ). A glassy-carbon electrode was used as the working electrode, a platinum-wire was used as the counter electrode, and a $\mathrm{Ag} / \mathrm{Ag}^{+}$electrode was used as the reference electrode. Polymers were coated on the surface of glassy-carbon electrode and all potentials were corrected against $\mathrm{Fc} / \mathrm{Fc}^{+}$. AFM was performed on a Multimode 8 microscope (Veeco). The thickness of the active layer was measured by using a KLA Tencor D-120 profilometer.

## 2. Device fabrication and measurements

### 2.1. Solar cell fabrication and characterization

Patterned ITO glass with a sheet resistance of $15 \Omega \mathrm{sq}^{-1}$ was ultrasonically cleaned using detergent, distilled water, acetone, isopropanol sequentially and then given UV-ozone treatment. A 30 nm thick poly(3,4-ethylenedioxythiophene)/polystyrenesulfonate (PEDOT:PSS, Clevios ${ }^{\text {TM }}$ P VP Al 4083) layer was formed on ITO substrates by spin coating an aqueous dispersion onto ITO glass ( 4000 rpm for 30 s ). PEDOT:PSS coated substrates were dried at $150{ }^{\circ} \mathrm{C}$ for 10 min . A P1/PC ${ }_{71} \mathrm{BM}$ blend ( $1: 1.6 \mathrm{w} / \mathrm{w}, 16 \mathrm{mg} / \mathrm{mL}$ ) in ODCB with $5 \mathrm{vol} \%$ DIO was spin-coated onto PEDOT:PSS layer ( 800 rpm for 60 s ). Finally, Ca ( $\sim 10 \mathrm{~nm}$ ) and $\mathrm{Al}(\sim 100 \mathrm{~nm})$ were thermally evaporated under a shadow mask (pressure ca. $10^{-4} \mathrm{~Pa}$ ). The effective area for the devices is $4 \mathrm{~mm}^{2}$. P2-P4 cells were fabricated through the same procedure. It should be noted that the active layers were spin-coated using chloroform solution. $J-V$ curves were measured with a computerized Keithley 2420 SourceMeter. Device characterization was done in air using a Xenon-lamp-based solar simulator (Newport, Oriel $91159 \mathrm{~A}, 150 \mathrm{~W}, \mathrm{AM} 1.5 \mathrm{G}, 100 \mathrm{~mW} / \mathrm{cm}^{2}$ ). The illumination intensity of solar simulator was determined using a monocrystalline silicon solar cell (Oriel 91150 Mode, $2 \times 2 \mathrm{~cm}$ ) calibrated
by NREL. The external quantum efficiency (EQE) was measured by a QE-R3011 measurement system (Enli Technology, Inc.).

### 2.2. Hole-only devices

The structure of hole-only devices is ITO/PEDOT:PSS/active layer/ $/ \mathrm{MoO}_{3} / \mathrm{Al}$. A 30 nm thick PEDOT:PSS layer was formed on ITO substrates by spin coating an aqueous dispersion onto ITO glass ( 4000 rpm for 30 s ). PEDOT:PSS coated substrates were dried at $150{ }^{\circ} \mathrm{C}$ for 10 min . A P1/PC ${ }_{71}$ BM blend ( $1: 1.6 \mathrm{w} / \mathrm{w}, 16 \mathrm{mg} / \mathrm{mL}$ ) in ODCB with $5 \mathrm{vol} \%$ DIO was spin-coated onto PEDOT:PSS layer ( 800 rpm for 60 s ). Finally, $\mathrm{MoO}_{3}(\sim 6 \mathrm{~nm})$ and $\mathrm{Al}(\sim 100 \mathrm{~nm})$ were successively evaporated onto the active layer under a shadow mask (pressure ca. $10^{-4} \mathrm{~Pa}$ ). P2$\mathbf{P 4}$ devices were fabricated through the same procedure. $J-V$ curves were measured with a computerized Keithley 2420 SourceMeter in the dark.

## 3. Synthetic procedures and spectra data

All reactions dealing with air- or moisture-sensitive compounds were carried out using standard Schlenk technique. All reagents were purchased from Alfa Aesar Co., Aladdin Co., J\&K Co., Aldrich Chemical Co., Solarmer Materials Inc., and other commercial suppliers. 2,8-Dibromo-4,10-bis(2-hexyldecyl)thieno[2',3':5,6]pyrido[3,4-g]thieno[3,2-c]isoquinoline$5,11(4 H, 10 H)$-dione ( $\mathbf{4 a}$ ) was synthesized according to our previous report. ${ }^{1} \mathrm{~N}$-(2-ethylhexyl)thiophen-3-amine (1b), 2,6-bis(trimethyltin)-4,8-bis(2-ethylhexyloxy)benzo[1,2$b: 4,5-b$ ']dithiophene (BDT) and 4,4-bis(2-ethylhexyl)-2,6-bis(trimethyltin)-dithieno[3,2$\left.b: 2^{\prime}, 3^{\prime}-d\right]$ silole (DTS) were synthesized according to literatures. ${ }^{2-4}$

2,5-Dibromo- $N^{1}, N^{4}$-bis(2-ethylhexyl)- $N^{1}, N^{4}$-di(thiophen-3-yl)terephthalamide (2b). To a solution of 2,5 -dibromoterephthalic acid ( $0.65 \mathrm{~g}, 2.0 \mathrm{mmol}$ ) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50 \mathrm{~mL})$ were added oxalyl chloride ( $2 \mathrm{~mL}, 22.8 \mathrm{mmol}$ ) and 2 drops of DMF. The mixture was stirred at room temperature overnight. The solvent was removed under vacuum to obtain 2,5dibromoterephthaloyl dichloride, which was used in next step without purification. To the solution of 2,5-dibromoterephthaloyl dichloride in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ was slowly added a solution of compound $\mathbf{1 b}(1.0 \mathrm{~g}, 4.7 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(1.3 \mathrm{~mL})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ at $0{ }^{\circ} \mathrm{C}$. The mixture was stirred at room temperature overnight. Then, the mixture was poured into water and extracted with $\mathrm{CHCl}_{3}$ three times. The organic layer was dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removal of the solvent, the crude product was purified through a silica gel
column with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ to give compound 2b as a yellow oil ( $1.01 \mathrm{~g}, 71 \%$ ). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $400 \mathrm{MHz}, \delta / \mathrm{ppm}): 7.13$ (dd, $J=4.9,3.3 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.09 (s, 2H), 6.85 (s, 2H), 6.77 (d, $J=5.1$ $\mathrm{Hz}, 2 \mathrm{H}), 3.76(\mathrm{br}, 4 \mathrm{H}), 1.55-1.49(\mathrm{~m}, 2 \mathrm{H}), 1.44-1.19(\mathrm{~m}, 16 \mathrm{H}), 0.88-0.83(\mathrm{~m}, 12 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}, \delta / \mathrm{ppm}\right): 166.69,140.29,139.58,131.92,125.69,125.40,120.80,117.88$, 51.92, 37.40, 30.23, 28.48, 23.56, 23.04, 14.07, 10.42.

## 7. Space charge limited current (SCLC) measurements

Charge carrier mobility was measured by SCLC method. The mobility was determined by fitting the dark current to the following formula:

$$
J=\frac{9}{8} \varepsilon_{0} \varepsilon_{r} \mu \frac{V^{2}}{d^{3}}
$$

where $J$ is the current density, $\mu$ is the zero-field mobility of holes, $\varepsilon_{0}$ is the permittivity of the vacuum, $\varepsilon_{\mathrm{r}}$ is the relative permittivity of the material, $d$ is the thickness of the blend film, and $V$ is the effective voltage, $V=V_{\text {appl }}-V_{\mathrm{bi}}$, where $V_{\text {appl }}$ is the applied voltage, and $V_{\mathrm{bi}}$ is the builtin potential determined by electrode workfunction difference. Figure S 3 shows $J-V$ curves for the hole-only devices. The mobility was calculated from the slope of $J^{1 / 2}-V$ curves.

Fig. S3 $J-V$ curves (a) and the corresponding $J^{1 / 2}-V$ curves (b) for hole-only devices (in dark). The thicknesses of the blend films are $95 \mathrm{~nm}, 107 \mathrm{~nm}, 100 \mathrm{~nm}$, and 97 nm , respectively.
