## Details for equilibrium and kinetic analysis

### 1. Equilibrium analysis for compound 1

Thermodynamic equilibrium constant for the SP and MC forms ( $K_{\text{eq}}$ ) is expressed as follows:<sup>[1]</sup>

$$K_{\text{eq}} = \frac{[\text{MC}]_{\text{eq}}}{[\text{SP}]_{\text{eq}}} \quad (1)$$

$$C_T = [\text{SP}]_{\text{eq}} + [\text{MC}]_{\text{eq}} = \frac{A_{\text{MC}}}{\varepsilon_{\text{MC}}} \left( 1 + \frac{1}{K_{\text{eq}}} \right) \quad (2)$$

where  $[\text{SP}]_{\text{eq}}$  and  $[\text{MC}]_{\text{eq}}$  are the equilibrium concentrations of the SP and MC forms,  $C_T$  is the total concentration of SP and MC forms, and  $A_{\text{MC}}$  and  $\varepsilon_{\text{MC}}$  are the absorbance and the molar extinction coefficient of the MC form, respectively.<sup>[2]</sup>  $K_{\text{eq}}$  was determined by equilibrium absorption analysis: the solutions containing different concentrations of **1** ( $C_T$ ) were stirred for 6 h in the dark at different temperature, and the MC absorbance ( $A_{\text{MC}}$ ) was plotted against  $C_T$  (Fig. S3). It must be noted that all of the solutions attain the absorption equilibrium by 6 h stirring. Linear relationship was observed between  $C_T$  and  $A_{\text{MC}}$  for all of the solutions. The  $\varepsilon_{\text{MC}}$  value of **1** in a water/MeCN (7/3 v/v) mixture ( $2.36 \times 10^4 \text{ M}^{-1} \text{ cm}^{-1}$ ) was determined at 298 K according to literature procedure.<sup>[3]</sup> The  $K_{\text{eq}}$  values for respective solutions at different temperatures were therefore determined with  $\varepsilon_{\text{MC}}$  and the slope of Fig. S3. The standard enthalpy ( $\Delta_r H$ ) and entropy ( $\Delta_r S$ ) for isomerization were determined using the van't Hoff equation (eq. 3).<sup>[4]</sup>

$$\ln K = -\frac{\Delta_r H}{RT} + \frac{\Delta_r S}{R} \quad (3)$$

The van't Hoff plots are shown in Fig. S4, and the obtained equilibrium parameters are summarized in Table S1.

### 2. Kinetic analysis for isomerization of **1**

Kinetic analysis for  $\text{SP} \rightarrow \text{MC}$  isomerization of **1** was carried out as follows:<sup>[5]</sup> The apparent rate constant for  $\text{SP} \rightarrow \text{MC}$  isomerization ( $k_{\text{obsd}}$ ) is expressed by the sum of the forward ( $k_{\text{SP} \rightarrow \text{MC}}$ ) and backward rate constant ( $k_{\text{MC} \rightarrow \text{SP}}$ ).<sup>[6]</sup>

$$k_{\text{obsd}} = k_{\text{SP} \rightarrow \text{MC}} + k_{\text{MC} \rightarrow \text{SP}} \quad (5)$$

The equilibrium constant,  $K_{\text{eq}}$  (eq. 1), is therefore rewritten as follows.

$$K_{\text{eq}} = \frac{k_{\text{SP} \rightarrow \text{MC}}}{k_{\text{MC} \rightarrow \text{SP}}} \quad (6)$$

The forward and backward rate constants are expressed as follows.

$$k_{\text{SP} \rightarrow \text{MC}} = \frac{K_{\text{eq}}}{1 + K_{\text{eq}}} k_{\text{obsd}} \quad (7)$$

$$k_{\text{MC} \rightarrow \text{SP}} = \frac{1}{1 + K_{\text{eq}}} k_{\text{obsd}} \quad (8)$$

The relationship between the MC absorbance and  $k_{\text{obsd}}$  is expressed as follows:<sup>[7]</sup>

$$\ln \left[ \frac{A_\infty - A_t}{A_\infty - A_0} \right] = -k_{\text{obsd}} t \quad (9)$$

where  $A_0$ ,  $A_t$ , and  $A_\infty$  are the absorbance at time 0,  $t$ , and infinity, respectively. Fig. S5 shows the plots of  $\ln[(A_\infty - A_t)/(A_\infty - A_0)]$  vs. time during SP→MC isomerization of **1** at different temperatures. The rate constants ( $k_{\text{SP} \rightarrow \text{MC}}$  and  $k_{\text{MC} \rightarrow \text{SP}}$ ) determined using the eqs. 7 and 8 are summarized in Table S1. The activation energy ( $E_a$ ) for isomerization is determined by the Arrhenius plots (Fig. S6),<sup>[8]</sup> using the following equation.

$$\ln k_{\text{SP} \rightarrow \text{MC}} = \ln A - \frac{E_a}{RT} \quad (10)$$

where  $A$  is frequency factor. The activation enthalpy ( $\Delta H^\ddagger$ ) and entropy ( $\Delta S^\ddagger$ ) for isomerization are expressed as follows:<sup>[9]</sup>

$$\Delta H^\ddagger = E_a - RT \quad (11)$$

$$\Delta S^\ddagger = R \left[ \ln A - 1 - \ln \frac{k_B T}{h} \right] \quad (12)$$

where  $k_B$  and  $h$  are the Boltzmann's constant and the Plank's constant, respectively.<sup>[8]</sup> The obtained  $\Delta H^\ddagger$  and  $\Delta S^\ddagger$  values are summarized in Table S1.
